Chapter 1. C/C++ Common Runtime Classes and Library Functions

The **ASN.1 C++ run-time classes** are wrapper classes that provide an object-oriented interface to the ASN.1 C run-time library functions. The categories of classes provided are as follows:

- Context Management classes manage the OSCTXT structure used to keep track of the working variables required to encode or decode ASN.1 messages.
- Message Buffer classes are used to manage message buffers.
- ASN1C Control Base classes are wrapper classes that are used as the base for compiler-generated ASN1C_ classes, including Date and Time Run-time classes.
- ASN.1 Type (ASN1T_) Base classes are used as the base for compiler-generated ASN1T_ C++ data structures.
- ASN.1 Stream classes are used to read and write ASN.1 messages from and to files, sockets, memory buffer, etc.
- TCP/IP or UDP Socket classes provide utility methods for doing socket I/O.
- Asn1NamedEventHandler classes include the base classes for user-defined error handler and event handler classes.

The **C run-time common library** contains common C functions used by the encoding rules (BER/DER, PER, and XER) low-level encode/decode functions. These functions are identified by their *rt* prefixes. The categories of functions provided are as follows:

- Memory Allocation macros and functions handle memory management for the ASN1C run-time.
- Context Management functions handle the allocation, initialization, and destruction of context variables (variables of type OSCTXT) that handle the working data used during encoding or decoding a message.
- Diagnostic Trace functions allow the output of trace messages to standard output that trace the execution of compiler generated functions.
- Error Formatting and Print functions allow information about the encode/decode errors to be added to a context block structure and printed out.
- Memory Buffer Management functions handle the allocation, expansion, and de-allocation of dynamic memory buffers used by some encode/decode functions.
- Object Identifier Helper functions provide assistance in working with the object identifier ASN.1 type.
- Linked List and Stack Utility functions are used to maintain linked lists and stacks used within the ASN.1 run-time library functions.
- REAL Helper functions - REAL helper functions provide assistance in working with the REAL ASN.1 type. Two functions are provided to obtain the plus and minus infinity special values.
- Formatted Printing functions allow raw ASN.1 data fields to be formatted and printed to standard output and other output devices.
- Binary Coded Decimal (BCD) helper functions provide assistance in working with BCD numbers.
- Character String Conversion functions convert between standard null-terminated C strings and different ASN.1 string types.

- Big Integer Helper functions are arbitrary-precision integer manipulating functions used to maintain big integers used within the ASN.1 run-time functions.
- Comparison functions allow comparison of the values of primitive ASN.1 types. They make it possible to compare complex structures and determine what elements within those structures are different.
- Comparison to Standard Output functions do the same actions as the other comparison functions, but print the comparison results to standard output instead of to the buffer.
- Copy functions - This group of functions allows copying values of primitive ASN.1 types.
- Print Values to Standard Output functions print the output in a "name=value" format, where the value format is obtained by calling one of the ToString functions with the given value.

Chapter 2. Module Documentation

C Runtime Common Functions

Detailed Description

The **C run-time common library** contains common C functions used by the low-level encode/decode functions. These functions are identified by their *rt* and *rtx* prefixes.

The categories of functions provided are as follows:

- Context management functions handle the allocation, initialization, and destruction of context variables (variables of type OSCTXT) that handle the working data used during the encoding or decoding of a message.
- Memory allocation macros and functions provide an optimized memory management interface.
- Doubly linked list (DList) functions are used to manipulate linked list structures that are used to model repeating XSD types and elements.
- UTF-8 and Unicode character string functions provide support for conversions to and from these formats in C or C++.
- Date/time conversion functions provide utilities for converting system and structured numeric date/time values to XML schema standard string format.
- Pattern matching function compare strings against patterns specified using regular expressions (regexp's).
- Diagnostic trace functions allow the output of trace messages to standard output.
- Error formatting and print functions allow information about encode/decode errors to be added to a context block structure and printed out.
- Memory buffer management functions handle the allocation, expansion, and de-allocation of dynamic memory buffers used by some encode/decode functions.
- Formatted print functions allow binary data to be formatted and printed to standard output and other output devices.
- Big Integer helper functions are arbitrary-precision integer manipulating functions used to maintain big integers.

Classes

- struct ASN1OctStr
- struct ASN1DynBitStr
- struct ASN1DynBitStr64
- struct ASN1BitStr32
- struct ASN1SeqOf
- struct ASN1SeqOfOctStr
- struct ASN1OpenType

- struct Asn1Object
- struct OSXSDAny
- struct Asn116BitCharString
- struct Asn132BitCharString
- struct Asn1CharArray
- struct Asn1CharSet
- struct Asn116BitCharSet
- struct Asn132BitCharSet
- struct ASN1BigInt
- struct ASN1CCB

Modules

- Object Identifier Helper Functions
- Time Helper Functions
- Character String Conversion Functions
- Comparison Functions
- Comparison to Standard Output Functions
- Copy Functions

Enumerations

- enum ASN1StrType {
ASN1HEX,
ASN1BIN,
ASN1CHR
}
- enum ASN1ActionType {
ASN1ENCODE,
ASN1DECODE
}
- enum OSXSDAnyAlt {
OSXSDAny_binary,
OSXSDAny_xmlText
}

Typedefs

- typedef void * ASN1ANY
- typedef Asn1Object ASN1Object

- typedef struct OSXSDAny OSXSDAny
- typedef OSUNICHAR ASN116BITCHAR
- typedef const char * ASN1GeneralizedTime
- typedef const char * ASN1GeneralString
- typedef const char * ASN1GraphicString
- typedef const char * ASN1IA5String
- typedef const char * ASN1ISO646String
- typedef const char * ASN1NumericString
- typedef const char * ASN1ObjectDescriptor
- typedef const char * ASN1PrintableString
- typedef const char * ASN1TeletexString
- typedef const char * ASN1T61String
- typedef const char * ASN1UTCTime
- typedef const char * ASN1VideotexString
- typedef const char * ASN1VisibleString
- typedef const OSUTF8CHAR * ASN1UTF8String
- typedef Asn116BitCharString ASN1BMPString
- typedef Asn132BitCharString ASN1UniversalString
- typedef struct ASN1BigInt ASN1BigInt
- typedef int(* ASN1DumpCbFunc

Macros

- #define ASN1NUMOCTS ((nbits>0)?(((nbits-1)/8)+1):0)

Enumeration Type Documentation

enum ASN1StrType

An enumerated list of the various string types: hexadecimal, binary, and character strings.

Enumerator:

ASN1HEX

ASN1BIN

ASN1CHR

Definition at line 252 of file asn1type.h

```
{
ASN1HEX,
ASN1BIN,
ASN1CHR,
}ASN1StrType;
```

enum ASN1ActionType

An enumerated list of ASN.1 actions: encode or decode.

Enumerator:

ASN1ENCODE

ASN1DECODE

Definition at line 257 of file asn1type.h

```
{
ASN1ENCODE,
ASN1DECODE,
}ASN1ActionType;
```

Typedef Documentation

typedef struct ASN1BigInt ASN1BigInt

A structure used to define an ASN.1 big integer. This structure is rarely, if ever, used by client code, and will instead be used by generated code to facilitate encoding and decoding integer values that cannot fit in normal C/C++ integer types.

typedef int(* ASN1DumpCbFunc) (const char *text_p, void *cbArg_p)

ASN.1 dump utility callback function definition

Macro Definition Documentation

#define XM_SEEK

seek match until found or end-of-buf

Definition at line 178 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define XM_ADVANCE

advance pointer to contents on match

Definition at line 180 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define XM_DYNAMIC

alloc dyn mem for decoded variable

Definition at line 182 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define XM_SKIP

skip to next field after parsing tag

Definition at line 184 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define XM_OPTIONAL

tag test is for optional element

Definition at line 186 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_MAXDEPTH

maximum nesting depth for messages

Definition at line 191 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_MAXENUM

maximum enum values in an enum type

Definition at line 193 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_MAXERRP

maximum error parameters

Definition at line 195 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_MAXERRSTK

maximum levels on error ctxt stack

Definition at line 197 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_ENCBUFSIZ

dynamic encode buffer extent size

Definition at line 201 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN_K_MEMBUFSEG

memory buffer extent size

Definition at line 206 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSRTINDENTSPACES

number of spaces for indent

Definition at line 210 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_PLUS_INFINITY

The ASN.1 Real value Plus Infinity.

Definition at line 215 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_MINUS_INFINITY

The ASN.1 Real value Minus Infinity.

Definition at line 218 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_NOT_A_NUMBER

The ASN.1 Real value Not-A-Number.

Definition at line 221 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_MINUS_ZERO

The ASN.1 Real value Minus Zero.

Definition at line 224 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1DynOctStr

We define ASN1DynOctStr to be the common generic OSDynOctStr type.

Definition at line 451 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSSETBIT

This macro sets the given bit in the given static bit string.

Table 2.1. Parameters

bitStr	The bit string to manipulate.
bitIndex	The index to set.

Definition at line 484 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSSETBITP

This macro sets the given bit in the given dynamic bit string.

Table 2.2. Parameters

pBitStr	A pointer-to-bit string to manipulate.
bitIndex	The index to set.

Definition at line 493 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSCLEARBIT

This macro clears the given bit in the given static bit string.

Table 2.3. Parameters

bitStr	The bit string to manipulate.
bitIndex	The index to clear.

Definition at line 502 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSCLEARBITP

This macro clears the given bit in the given dynamic bit string.

Table 2.4. Parameters

pBitStr	The pointer-to-bit string to manipulate.
bitIndex	The index to clear.

Definition at line 511 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSTESTBIT

This macro tests the given bit in the given static bit string.

Table 2.5. Parameters

bitStr	The bit string to manipulate.
bitIndex	The index to test.

Returns: . TRUE if the bit is on; FALSE if the bit is off.

Definition at line 522 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSTESTBITP

This macro tests the given bit in the given dynamic bit string.

Table 2.6. Parameters

pBitStr	The pointer-to-bit string to manipulate.
bitIndex	The index to set.

Definition at line 531 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_CCBMaskSize

The maximum size for the context control block mask.

Definition at line 1414 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_NumBitsPerMask

The number of bits that can be set per mask.

Definition at line 1417 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ASN1_K_MaxSetElements

The maximum number of set elements that can be handled by the CCB.

Definition at line 1420 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

Object Identifier Helper Functions

Detailed Description

Object identifier helper functions provide assistance in working with the object identifier ASN.1 type.

Classes

- struct ASN1OBJID
- struct ASN1OID64

Functions

- void rtSetOID (ASN1OBJID * ptarget, ASN1OBJID * psource)
- void rtAddOID (ASN1OBJID * ptarget, ASN1OBJID * psource)
- OSBOOL rtOIDsEqual (const ASN1OBJID * pOID1, const ASN1OBJID * pOID2)
- int rtOIDParseCompList (const char * str, OSSIZE strlen, ASN1OBJID * pvalue)
- int rtOIDParseString (const char * oidstr, OSSIZE oidstrlen, ASN1OBJID * pvalue)
- int rtRelOIDParseCompList (const char * str, OSSIZE strlen, ASN1OBJID * pvalue)
- int rtRelOIDParseString (const char * oidstr, OSSIZE oidstrlen, ASN1OBJID * pvalue)
- int rtOIDParseDottedNumberString (const char * oidstr, OSSIZE oidstrlen, ASN1OBJID * pvalue)
- OSBOOL rtOIDIsValid (const ASN1OBJID * pvalue)

Macros

- #define ASN_K_MAXSUBIDS 128 /* maximum sub-id's in an object ID */

Function Documentation

void rtSetOID (ASN1OBJID *ptarget, ASN1OBJID *psource)

This function populates an object identifier variable with data. It copies data from a source variable to a target variable. Typically, the source variable is a compiler-generated object identifier constant that resulted from an object identifier value specification within an ASN.1 specification.

Table 2.7. Parameters

ptarget	A pointer to a target object identifier variable to receive object * identifier data. Typically, this is a variable within a compiler-generated C structure.
psource	A pointer to a source object identifier variable to copy to a target. Typically, this is a compiler-generated variable corresponding to an ASN.1 value specification in the ASN.1 source file.

void rtAddOID (ASN1OBJID *ptarget, ASN1OBJID *psource)

This function appends one object identifier to another one. It copies the data from a source variable to the end of a target variable. Typically, the source variable is a compiler-generated object identifier constant that resulted from an object identifier value specification within an ASN.1 specification.

Table 2.8. Parameters

ptarget	A pointer to a target object identifier variable to receive object identifier data. Typically, this is a variable within a compiler-generated C structure.
psource	A pointer to a source object identifier variable to copy to a target. Typically, this is a compiler-generated variable corresponding to an ASN.1 value specification in the ASN.1 source file.

OSBOOL rtOIDsEqual (const ASN1OBJID *pOID1, const ASN1OBJID *pOID2)

This function compares two OID values for equality.

Table 2.9. Parameters

pOID1	Pointer to first OID value to compare.
pOID2	Pointer to second OID value to compare.

Returns: . True if OID's are equal.

int rtOIDParseCompList (const char *str, OSSIZE strlen, ASN1OBJID *pvalue)

This function parses the ObjIdComponentsList of an ObjectIdentifierValue. Components that use only a name can be converted if that form was used as permitted by X.680 & X.660. Leading and trailing whitespace is ignored.

Table 2.10. Parameters

str	OID string containing data to be parsed. It does not have to be null-terminated.
strlen	Length of the string.
pvalue	Pointer to OID value to receive parsed OID.

Returns: . Status of operation: 0 = success, negative value is failure.

int rtOIDParseString (const char *oidstr, OSSIZE oidstrlen, ASN1OBJID *pvalue)

This function parses an OID that is an XMLObjectIdentifierValue. Components that use only a name can be converted if that form was used as permitted by X.680 & X.660. Leading and trailing whitespace is ignored.

Table 2.11. Parameters

oidstr	OID string containing data to be parsed. It does not have to be null-terminated.
oidstrlen	Length of the string.
pvalue	Pointer to OID value to receive parsed OID.

Returns: . Status of operation: 0 = success, negative value is failure.

int rtRelOIDParseCompList (const char *str, OSSIZE strlen, ASN1OBJID *pvalue)

This function parses the RelativeOIDComponentsList of a RelativeOIDValue. Name-only components are not supported. Leading and trailing whitespace is ignored.

Table 2.12. Parameters

str	String containing data to be parsed. It does not have to be null-terminated.
strlen	Length of the string.
pvalue	Pointer to OID value to receive parsed OID.

Returns: . Status of operation: 0 = success, negative value is failure.

int rtRelOIDParseString (const char *oidstr, OSSIZE oidstrlen, ASN1OBJID *pvalue)

This function parses an OID that is an XMLRelativeOIDValue. Name-only components are not supported. Leading and trailing whitespace is ignored.

Table 2.13. Parameters

oidstr	OID string containing data to be parsed. It does not have to be null-terminated.
oidstrlen	Length of the string.
pvalue	Pointer to OID value to receive parsed OID.

Returns: . Status of operation: 0 = success, negative value is failure.

int rtOIDParseDottedNumberString (const char *oidstr, OSSIZE oidstrlen, ASN1OBJID *pvalue)

This function parses an OID dotted number string (n.n.n) which is the form of OID XML content. Data must be in the form of numbers and dots only (i.e. OID components in other forms such as names or named number will cause a parse failure). Embedded whitespace will be ignored.

Table 2.14. Parameters

oidstr	OID string containing data to be parsed.
oidstrlen	Length of the string.
pvalue	Pointer to OID value to receive parsed OID.

Returns: . Status of operation: 0 = success, negative value is failure.

OSBOOL rtOIDsValid (const ASN1OBJID *pvalue)

This function determine if an OID value is valid according to ASN.1 rules. In particular it checks a) if number of subidentifiers is greater than or equal to 2, b) if the first subidentifier value is less than or equal to 2, and c) if the first subidentifier is 2 that the second subidentifier is less than 40.

Table 2.15. Parameters

pvalue	Pointer to OID value to validate.
--------	-----------------------------------

Returns: . True if OID value is valid.

Time Helper Functions

Detailed Description

Utility functions for working with time strings in different formats. rtMake* functions create time strings, rtParse* functions parse time strings. For ASN.1 GeneralizedTime and UTCTime, the C type is used is the OSNumDateTime structure defined in osSysTypes.h. For ASN.1 TIME, the ASN1Time struct is used.

Classes

- struct ASN1DateTime
- struct ASN1Duration
- struct ASN1IntervalDE
- struct ASN1IntervalSE
- struct ASN1IntervalSD
- struct ASN1Interval
- struct ASN1Time

Typedefs

- typedef struct ASN1DateTime ASN1DateTime
- typedef struct ASN1Duration ASN1Duration
- typedef struct ASN1IntervalDE ASN1IntervalDE
- typedef struct ASN1IntervalSE ASN1IntervalSE
- typedef struct ASN1IntervalSD ASN1IntervalSD
- typedef struct ASN1Interval ASN1Interval
- typedef struct ASN1Time ASN1Time

Functions

- int rtMakeGeneralizedTime (OSCTXT * pctxt, const OSNumDateTime * dateTime, char ** outdata, size_t outdataSize)
- int rtMakeTime (OSCTXT * pctxt, const ASN1Time * timeVal, char ** outdata, size_t outdataSize)
- int rtMakeUTCTime (OSCTXT * pctxt, const OSNumDateTime * dateTime, char ** outdata, size_t outdataSize)
- int rtParseGeneralizedTime (OSCTXT * pctxt, const char * value, OSNumDateTime * dateTime)
- int rtParseGeneralizedTime2 (OSCTXT * pctxt, const char * value, OSNumDateTime * dateTime, OSBOOL logCanon)
- int rtParseUTCTime (OSCTXT * pctxt, const char * value, OSNumDateTime * dateTime)
- int rtParseUTCTime2 (OSCTXT * pctxt, const char * value, OSNumDateTime * dateTime, OSBOOL logCanon)
- int rtParseTime (OSCTXT * pctxt, const char * value, ASN1Time * timeVal, OSBOOL logCanon)
- void normalizeTimeZone (OSNumDateTime * pvalue)

Macros

- #define ASN1TIMEFIELD_CENTURY 0x01
- #define ASN1TIMEFIELD_YEAR 0x02
- #define ASN1TIMEFIELD_MONTH 0x04
- #define ASN1TIMEFIELD_DAY 0x08
- #define ASN1TIMEFIELD_WEEK 0x10
- #define ASN1TIMEFIELD_HOUR 0x20
- #define ASN1TIMEFIELD_MIN 0x40
- #define ASN1TIMEFIELD_SEC 0x80
- #define ASN1TIMEFIELD_Z 0x0100
- #define ASN1TIMEFIELD_DIFF 0x0200

- #define ASN1TIMEFIELD_INTERVAL_SE 0x0400
- #define ASN1TIMEFIELD_DURATION 0x0800
- #define ASN1TIMEFIELD_INTERVAL_SD 0x1000
- #define ASN1TIMEFIELD_INTERVAL_DE 0x2000
- #define ASN1TIMEFIELD_RECUR_INF 0x4000
- #define ASN1TIMEFIELD_POINT (ASN1TIMEFIELD_CENTURY | ASN1TIMEFIELD_YEAR | \
 \ ASN1TIMEFIELD_MONTH | ASN1TIMEFIELD_DAY | ASN1TIMEFIELD_WEEK | \
 \ ASN1TIMEFIELD_HOUR | ASN1TIMEFIELD_MIN | ASN1TIMEFIELD_SEC | \ ASN1TIMEFIELD_Z)

Typedef Documentation

typedef struct ASN1Duration ASN1Duration

Represents a duration of time. Durations are supposed to have weeks only, or a combination of years, months, ..., seconds. Durations of different precision are considered distinct values, even if their components are equal. "PT6H" and "PT6H0S" are considered distinct values and have a distinct ASN1Duration representations. "PODT6H" and "PT6H" are considered equal and have the same ASN1Duration representation.

typedef struct ASN1IntervalDE ASN1IntervalDE

Represents an interval with a duration and possibly an end point.

typedef struct ASN1IntervalSE ASN1IntervalSE

Represents an interval with a start point and an end point.

typedef struct ASN1IntervalSD ASN1IntervalSD

Represents an interval with a start point and a duration.

typedef struct ASN1Interval ASN1Interval

Represents a recurring or non-recurring interval.

typedef struct ASN1Time ASN1Time

Represents an ASN.1 TIME abstract value. The settings field indicates what fields are present.

Function Documentation

int rtMakeGeneralizedTime (OSCTXT *pctx, const OSNumDateTime *dateTime, char **outdata, size_t outdataSize)

This function creates a time string in ASN.1 GeneralizedTime format as specified in the X.680 ITU-T standard.

Table 2.16. Parameters

pctx	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
------	--

dateTime	A pointer to a date/time structure that contains components of the date and time.
outdata	A pointer to a pointer to a destination string. If outdataSize is non-zero, it should be a pointer to a pointer to an actual array. Otherwise, the memory will be allocated and the pointer will be stored in the outdata.
outdataSize	A size of outdata (in octets). If zero, the memory for the outdata will be allocated. If not, the outdata's size should be big enough to receive the generated time string. Otherwise, error code will be returned.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtMakeTime (OSCTXT *pctxt, const ASN1Time *timeVal, char **outdata, size_t outdataSize)

This function creates a time string in ASN.1 TIME format as specified in the X.680 ITU-T standard. The string is a canonical value representation as required by CER/DER (note this is not exactly the same as the encoded representation; see X.690:2015 8.26 and 11.9).

Table 2.17. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
timeVal	A pointer to an ASN1Time structure that contains value.
outdata	A pointer to a pointer to a destination string. If outdataSize is non-zero, it should be a pointer to a pointer to an actual array. Otherwise, the memory will be allocated and the pointer will be stored in the outdata.
outdataSize	A size of outdata (in octets). If zero, the memory for the outdata will be allocated. If not, the outdata's size should be big enough to receive the generated time string. Otherwise, an error code will be returned.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtMakeUTCTime (OSCTXT *pctxt, const OSNumDateTime *dateTime, char **outdata, size_t outdataSize)

This function creates a time string in ASN.1 UTCTime format as specified in the X.680 ITU-T standard.

Table 2.18. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
-------	--

dateTime	A pointer to a date/time structure that contains components of the date and time.
outdata	A pointer to a pointer to a destination string. If outdataSize is non-zero, it should be a pointer to a pointer to an actual array. Otherwise, the memory will be allocated and the pointer will be stored in the outdata.
outdataSize	A size of outdata (in octets). If zero, the memory for the outdata will be allocated. If not, the outdata's size should be big enough to receive the generated time string. Otherwise, error code will be returned.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtParseGeneralizedTime (OSCTXT *pctxt, const char *value, OSNumDateTime *dateTime)

This function parses a time string that is represented in ASN.1 GeneralizedTime format as specified in the X.680 ITU-T standard. It stores the parsed result in a numeric date/time C structure.

If the ASN1CANON or ASN1DER flag is set, and the given value is not a canonical encoding representation, this function will log a non-fatal ASN_E_NOTCANON error (this does not cause a negative return).

Table 2.19. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
value	A pointer to the time string to be parsed.
dateTime	A pointer to the destination structure.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtParseGeneralizedTime2 (OSCTXT *pctxt, const char *value, OSNumDateTime *dateTime, OSBOOL logCanon)

This function is the same as rtParseGeneralizedTime except as follows. When the ASN1CANON or ASN1DER flag is set, if there are canonical violations and no actual errors, this function will return ASN_E_NOTCANON and, if logCanon is true, it will also log non-fatal ASN_E_NOTCANON errors.

Table 2.20. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
value	A pointer to the time string to be parsed.
dateTime	A pointer to the destination structure.

logCanon	Controls whether to log canonical violations or not.
----------	--

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtParseUTCTime (OSCTXT *pctx, const char *value, OSNumDateTime *dateTime)

This function parses a time string that is represented in ASN.1 UTCTime format as specified in the X.680 ITU-T standard. It stores the parsed result in a numeric date/time C structure.

If the ASN1CANON or ASN1DER flag is set, and the given value is not a canonical encoding representation, this function will log a non-fatal ASN_E_NOTCANON error (this does not cause a negative return).

Table 2.21. Parameters

pctx	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
value	A pointer to the time string to be parsed.
dateTime	A pointer to the destination date/time structure.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtParseUTCTime2 (OSCTXT *pctx, const char *value, OSNumDateTime *dateTime, OSBOOL logCanon)

This function is the same as rtParseUTCTime except as follows. When the ASN1CANON or ASN1DER flag is set, if there are canonical violations and no actual errors, this function will return ASN_E_NOTCANON and, if logCanon is true, it will also log non-fatal ASN_E_NOTCANON errors.

Table 2.22. Parameters

pctx	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
value	A pointer to the time string to be parsed.
dateTime	A pointer to the destination date/time structure.
logCanon	Controls whether to log canonical violations or not.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtParseTime (OSCTXT *pctxt, const char *value, ASN1Time *timeVal, OSBOOL logCanon)

Parse an ASN.1 TIME value representation.

If the ASN1CANON or ASN1DER context flag is set, this will also check that the CER/DER canonical value representation is used. If logCanon is TRUE, a violation will result in logging a non-fatal ASN1_E_NOTCANON error. Otherwise, a violation will only result in returning ASN1_E_NOTCANON.

Table 2.23. Parameters

pctxt	A pointer to a context structure. This is used for the canonical flags and for logging errors.
value	The value to parse.
timeVal	Receives the result of the parsing.
logCanon	As described above.

void normalizeTimeZone (OSNumDateTime *pvalue)

This function normalizes the time zone for the given datetime structure.

Table 2.24. Parameters

pvalue	A pointer-to an OSNumDateTime structure.
--------	--

Macro Definition Documentation

#define ASN1TIMEFIELD_CENTURY

ASN1TIMEFIELD_ macros are bit flags used to indicate what fields are present in an ASN.1 TIME abstract value.

For year, the value of the year can be used to determine the setting for the Year property (i.e. Basic, Proleptic, Negative, L5, L6, etc..

For intervals, ASN1TIMEFIELD_RECUR_INF is used to signal infinite recurrences while the number of recurrences (0 or more) can be used to distinguish between a non-recurring interval and an R1, R2, etc. recurring interval.

Where fractions may appear, the number of fraction digits can be used to distinguish between no fraction (0 fraction digits) and F1, F2, etc..

Character String Conversion Functions

Detailed Description

Common utility functions are provided to convert between standard null-terminated C strings and different ASN.1 string types.

Functions

- `int rtValidateStr (ASN1TAG tag, const char * pdata)`
- `int rtValidateChars (ASN1TAG tag, const char * pdata, size_t nchars)`
- `const char * rtBMPToCString (ASN1BMPString * pBMPString, char * cstring, OSSIZE cstrsize)`
- `const char * rtBMPToNewCString (ASN1BMPString * pBMPString)`
- `const char * rtBMPToNewCStringEx (OSCTXT * pctxt, ASN1BMPString * pBMPString)`
- `ASN1BMPString * rtCToBMPString (OSCTXT * pctxt, const char * cstring, ASN1BMPString * pBMPString, Asn116BitCharSet * pCharSet)`
- `OSBOOL rtIsIn16BitCharSet (OSUNICHAR ch, Asn116BitCharSet * pCharSet)`
- `const char * rtUCSToCString (ASN1UniversalString * pUCSString, char * cstring, OSSIZE cstrsize)`
- `const char * rtUCSToNewCString (ASN1UniversalString * pUCSString)`
- `const char * rtUCSToNewCStringEx (OSCTXT * pctxt, ASN1UniversalString * pUCSString)`
- `ASN1UniversalString * rtCToUCSString (OSCTXT * pctxt, const char * cstring, ASN1UniversalString * pUCSString, Asn132BitCharSet * pCharSet)`
- `OSBOOL rtIsIn32BitCharSet (OS32BITCHAR ch, Asn132BitCharSet * pCharSet)`
- `wchar_t * rtUCSToWCSSString (ASN1UniversalString * pUCSString, wchar_t * wcstring, OSUINT32 wcstrsize)`
- `ASN1UniversalString * rtWCSToUCSString (OSCTXT * pctxt, wchar_t * wcstring, ASN1UniversalString * pUCSString, Asn132BitCharSet * pCharSet)`
- `int rtUnivStrToUTF8 (OSCTXT * pctxt, const ASN1UniversalString * pUnivStr, OSOCTET * outbuf, size_t outbufsiz)`
- `int rtUTF8StrToASN1DynBitStr (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, ASN1DynBitStr * pvalue)`
- `int rtUTF8StrmToASN1DynBitStr (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, size_t nbytes, ASN1DynBitStr * pvalue)`

Function Documentation

int rtValidateStr (ASN1TAG tag, const char *pdata)

This function ensures that a given string does not contain invalid characters.

Table 2.25. Parameters

tag	The ASN.1 Tag that identifies the string.
pdata	A pointer to the character string to be examined.

Returns: . This function returns 0 if the string validates or the tag is not associated with a string; it otherwise returns the integer value of the character that invalidates the string.

int rtValidateChars (ASN1TAG tag, const char *pdata, size_t nchars)

This function ensures that a given string does not contain invalid characters.

Table 2.26. Parameters

tag	The ASN.1 Tag that identifies the string.
pdata	A pointer to the character string to be examined.
nchars	The number of characters in pdata.

Returns: . This function returns 0 if the string validates or the tag is not associated with a string; it otherwise returns the integer value of the character that invalidates the string.

const char* rtBMPToCString (ASN1BMPString *pBMPString, char *cstring, OSSIZE cstrsize)

This function converts a BMP string into a null-terminated C string. Any characters that are not 8-bit characters are discarded.

Table 2.27. Parameters

pBMPString	A pointer to a BMP string structure to be converted.
cstring	A pointer to a buffer to receive the converted string.
cstrsize	The size of the buffer to receive the converted string.

Returns: . A pointer to the returned string structure. This is the cstring argument parameter value.

const char* rtBMPToNewCString (ASN1BMPString *pBMPString)

This function converts a BMP string into a null-terminated C string. Any characters that are not 8-bit characters are discarded. This function allocates dynamic memory to hold the converted string using the standard C run-time malloc function. The user is responsible for freeing this memory.

Table 2.28. Parameters

pBMPString	A pointer to a BMP string structure to be converted.
------------	--

Returns: . A pointer to the returned string structure. This is the cstring argument parameter value.

const char* rtBMPToNewCStringEx (OSCTXT *pctxt, ASN1BMPString *pBMPString)

This function converts a BMP string into a null-terminated C string. Any characters that are not 8-bit characters are discarded. In contrast to rtBMPToNewCString, this function allocates dynamic memory to hold the converted string using the rtMemAlloc function. The rtMemFreePtr should be called to release the allocated memory or the rtmemFree function should be called to release all memory allocated using the specified context block.

Table 2.29. Parameters

pctxt	A pointer to a context structure.
pBMPString	A pointer to a BMP string structure to be converted.

Returns: . A pointer to the returned string structure. This is the cstring argument parameter value.

ASN1BMPString* rtCToBMPString (OSCTXT *pctxt, const char *cstring, ASN1BMPString *pBMPString, Asn116BitCharSet *pCharSet)

This function converts a null-terminated C string into a 16-bit BMP string structure.

Table 2.30. Parameters

pctxt	A pointer to a context string.
cstring	A pointer to a null-terminated C string to be converted into a BMP string.
pBMPString	A pointer to a BMP string structure to receive the converted string.
pCharSet	A pointer to a character set structure describing the character set currently associated with the BMP character string type.

Returns: . A pointer to BMP string structure. This is the pBMPString argument parameter value.

OSBOOL rtIsIn16BitCharSet (OSUNICHAR ch, Asn116BitCharSet *pCharSet)

This function tests whether the given character is in the given 16-bit character set.

Table 2.31. Parameters

ch	A 16-bit character.
pCharSet	A pointer-to Asn116BitCharSet that contains the set of valid character.

Returns: . TRUE if the character is in the set, FALSE otherwise.

const char* rtUCSToCString (ASN1UniversalString *pUCSString, char *cstring, OSSIZE cstrsize)

This function converts a Universal 32-bit string into a null-terminated C string. Any characters that are not 8-bit characters are discarded.

Table 2.32. Parameters

pUCSString	A pointer to a Universal string structure to be converted.
cstring	A pointer to a buffer to receive a converted string.
cstrsize	The size of the buffer to receive the converted string.

Returns: . The pointer to the returned string. This is the cstring argument parameter value.

const char* rtUCSToNewCString (ASN1UniversalString *pUCSString)

This function converts a Universal 32-bit string into a null-terminated C string. Any characters that are not 8-bit characters are discarded. This function allocates dynamic memory to hold the converted string using the standard C run-time malloc function. The user is responsible for freeing this memory.

Table 2.33. Parameters

pUCSString	A pointer to a Universal 32-bit string structure to be converted.
------------	---

Returns: . A pointer to allocated null-terminated string. The user is responsible for freeing this memory.

const char* rtUCSToNewCStringEx (OSCTXT *pctxt, ASN1UniversalString *pUCSString)

This function converts a Universal 32-bit string into a null-terminated C string. Any characters that are not 8-bit characters are discarded. In contrast to rtUSCToNewCString this function allocates dynamic memory to hold the converted string using the rtMemAlloc function. The rtMemFreePtr should be called to release the allocated memory or the rtMemFree function should be called to release all memory allocated using the specified context block.

Table 2.34. Parameters

pctxt	A pointer to a context block.
pUCSString	A pointer to a Universal 32-bit string structure to be converted.

Returns: . A pointer to allocated null-terminated string. The user is responsible for freeing this memory.

ASN1UniversalString* rtCToUCSString (OSCTXT *pctxt, const char *cstring, ASN1UniversalString *pUCSString, Asn132BitCharSet *pCharSet)

This function converts a null-terminated C string into a 32-bit UCS-4 (Universal Character Set, 4 bytes) string structure.

Table 2.35. Parameters

pctxt	A pointer to a context structure.
cstring	A pointer to a null-terminated C string to be converted into a Universal string.
pUCSString	A pointer to a Universal string structure to receive the converted string
pCharSet	A pointer to a character structure describing the character set currently associated with the Universal character string type.

Returns: . A pointer to a Universal string structure. This is the pUCSString argument parameter value.

OSBOOL rtlIsIn32BitCharSet (OS32BITCHAR ch, Asn132BitCharSet *pCharSet)

This function tests whether the given character is in the given 32-bit character set.

Table 2.36. Parameters

ch	A 32-bit character.
pCharSet	A pointer-to Asn132BitCharSet that contains the set of valid character.

Returns: . TRUE if the character is in the set, FALSE otherwise.

wchar_t* rtUCSToWCSString (ASN1UniversalString *pUCSString, wchar_t *wcstring, OSUINT32 wcsrsize)

This function converts a 32-bits encoded string to a wide character string.

Table 2.37. Parameters

pUCSString	A pointer to a Universal string structure.
wcstring	The pointer to the buffer to receive the converted string.
wcsrsize	The number of wide characters (wchar_t) the outbuffer can hold.

Returns: . A character count or error status. This will be negative if the conversion fails. If the result is positive, the number of characters was written to scsrsize.

ASN1UniversalString* rtWCSToUCSString (OSCTXT *pctxt, wchar_t *wcstring, ASN1UniversalString *pUCSString, Asn132BitCharSet *pCharSet)

This function converts a wide-character string to a Universal 32-bits encoded string.

Table 2.38. Parameters

pctxt	A pointer to a context structure.
wcstring	The pointer to the wide-character (Unicode) string to convert
pUCSString	The pointer to the Universal String structure to receive the converted string.
pCharSet	The pointer to the character set structure describing the character set currently associated with the Universal character string type.

Returns: . If the conversion of the WCS to the UTF-8 was successful, the number of bytes in the converted string is returned. If the encoding fails, a negative status value is returned.

int rtUnivStrToUTF8 (OSCTXT *pctxt, const ASN1UniversalString *pUnivStr, OSOCTET *outbuf, size_t outbufsiz)

This function converts an ASN.1 Universal String type (32-bit characters) to UTF-8.

Table 2.39. Parameters

pctxt	A pointer to a context structure.
pUnivStr	Pointer to universal string to be converted.
outbuf	Output buffer to receive UTF-8 characters.

outbufsiz	Output buffer size in bytes.
-----------	------------------------------

Returns: . Zero if conversion was successful, a negative status code if failed.

int rtUTF8StrToASN1DynBitStr (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, ASN1DynBitStr *pvalue)

This function converts the given null-terminated UTF-8 string to a bit string value. The string consists of a series of '1' and '0' characters. This is the dynamic version in which memory is allocated for the returned binary string variable. Bits are stored from MSB to LSB order.

Table 2.40. Parameters

pctxt	Pointer to context block structure.
utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to a variable to receive the decoded boolean value.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtUTF8StrnToASN1DynBitStr (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, size_t nbytes, ASN1DynBitStr *pvalue)

This function converts the given part of UTF-8 string to a bit string value. The string consists of a series of '1' and '0' characters. This is the dynamic version in which memory is allocated for the returned binary string variable. Bits are stored from MSB to LSB order.

Table 2.41. Parameters

pctxt	Pointer to context block structure.
utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to a variable to receive the decoded boolean value.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

Comparison Functions

Detailed Description

The group of functions allows comparing the values of primitive ASN.1 types. These functions are used in the comparison routines that are generated by the ASN1C compiler when the *-gencompare* option is used.

Information on elements that do not match is written to the given error buffer for each function. This makes it possible to compare complex structures and get back specific information as to what elements within those structures are different.

Functions

- OSBOOL rtCmpBoolean (const char * name, OSBOOL value, OSBOOL compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpInt8 (const char * name, OSINT8 value, OSINT8 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpSInt (const char * name, OSINT16 value, OSINT16 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpUInt8 (const char * name, OSUINT8 value, OSUINT8 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpUSInt (const char * name, OSUINT16 value, OSUINT16 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpInteger (const char * name, OSINT32 value, OSINT32 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpUnsigned (const char * name, OSUINT32 value, OSUINT32 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpInt64 (const char * name, OSINT64 value, OSINT64 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpUInt64 (const char * name, OSUINT64 value, OSUINT64 compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpBitStr (const char * name, OSSIZE numbits, const OSOCTET * data, OSSIZE compNumbits, const OSOCTET * compData, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpBitStrExt (const char * name, OSSIZE numbits, const OSOCTET * data, OSSIZE dataSize, const OSOCTET * extdata, OSSIZE compNumbits, const OSOCTET * compData, const OSOCTET * compExtdata, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpOctStr (const char * name, OSSIZE numocts, const OSOCTET * data, OSSIZE compNumocts, const OSOCTET * compData, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpCharStr (const char * name, const char * cstring, const char * compCstring, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmp16BitCharStr (const char * name, Asn116BitCharString * bstring, Asn116BitCharString * compBstring, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmp32BitCharStr (const char * name, Asn132BitCharString * bstring, Asn132BitCharString * compBstring, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpReal (const char * name, OSREAL value, OSREAL compValue, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpOIDValue (const char * name, ASN1OBJID * pOID, ASN1OBJID * pcompOID, char * errBuff, OSSIZE errBuffSize)

- OSBOOL rtCmpOID64Value (const char * name, ASN1OID64 * pOID, ASN1OID64 * pcompOID, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpOpenType (const char * name, OSSIZE numocts, const OSOCTET * data, OSSIZE compNumocts, const OSOCTET * compData, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpOpenTypeExt (const char * name, OSRTDList * pElemList, OSRTDList * pCompElemList, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpTag (const char * name, int tag, int compTag, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpSeqOfElements (const char * name, OSSIZE noOfElems, OSSIZE compNoOfElems, char * errBuff, OSSIZE errBuffSize)
- OSBOOL rtCmpOptional (const char * name, unsigned presentBit, unsigned compPresentBit, char * errBuff, OSSIZE errBuffSize)

Macros

- #define rtCmpOID rtCmpOIDValue
- #define rtCmpOID64 rtCmpOID64Value

Function Documentation

OSBOOL rtCmpBoolean (const char *name, OSBOOL value, OSBOOL compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpBoolean function compares two ASN.1 Boolean values. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.42. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpInt8 (const char *name, OSINT8 value, OSINT8 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpInt8 function compares two ASN.1 8-bit integers. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.43. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpSInt (const char *name, OSINT16 value, OSINT16 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpSInt function compares two ASN.1 16-bit integers. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.44. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpUInt8 (const char *name, OSUINT8 value, OSUINT8 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpUInt8 function compares unsigned ASN.1 8-bit integers. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.45. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpUSInt (const char *name, OSUINT16 value, OSUINT16 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpUSInt function compares ASN.1 unsigned 16-bit integers. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.46. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpInteger (const char *name, OSINT32 value, OSINT32 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpInteger function compares two ASN.1 INTEGER values.

Table 2.47. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpUnsigned (const char *name, OSUINT32 value, OSUINT32 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpUnsigned function compares two ASN.1 unsigned INTEGER values.

Table 2.48. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.

compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmplInt64 (const char *name, OSINT64 value, OSINT64 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCompInt64 function compares two 64-bit ASN.1 INTEGER values.

Table 2.49. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpUInt64 (const char *name, OSUINT64 value, OSUINT64 compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpUInt64 function compares two 64-bit ASN.1 unsigned INTEGER values.

Table 2.50. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpBitStr (const char *name, OSSIZE numbits, const OSOCTET *data, OSSIZE compNumbits, const OSOCTET *compData, char *errBuff, OSSIZE errBuffSize)

The rtCmpBitStr function compares two ASN.1 BIT STRING values.

Table 2.51. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
numbits	The number of bits in the first value to compare.
data	The pointer to the data of the first value to compare.
compNumbits	The number of bits in the second value to compare.
compData	The pointer to the data of the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpBitStrExt (const char *name, OSSIZE numbits, const OSOCTET *data, OSSIZE dataSize, const OSOCTET *extdata, OSSIZE compNumbits, const OSOCTET *compData, const OSOCTET *compExtdata, char *errBuff, OSSIZE errBuffSize)

The rtCmpBitStrExt function compares two ASN.1 BIT STRING values containing extdata fields.

Table 2.52. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
numbits	The number of bits in the first value to compare.
data	The pointer to the data of the first value to compare.
dataSize	Size of the array pointed to by data and compData.
extdata	The pointer to the extdata of the first value to compare.
compNumbits	The number of bits in the second value to compare.
compData	The pointer to the data of the second value to compare.
compExtdata	The pointer to the extdata of the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOctStr (const char *name, OSSIZE numocts, const OSOCTET *data, OSSIZE compNumocts, const OSOCTET *compData, char *errBuff, OSSIZE errBuffSize)

The rtCmpOctStr function compares two ASN.1 OCTET STRING values.

Table 2.53. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
numocts	The number of the octets in the first value to compare.
data	The pointer to the data of the first value to compare.
compNumocts	The number of the octets in the second value to compare.
compData	The pointer to the data of the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpCharStr (const char *name, const char *cstring, const char *compCstring, char *errBuff, OSSIZE errBuffSize)

The rtCmpCharStr function compares two ASN.1 8-bit character sting values (including IA5String, VisibleString, PrintableString, NumericString, etc.)

Table 2.54. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
cstring	The first standard null-terminated string to compare.
compCstring	The second standard null-terminated string to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmp16BitCharStr (const char *name, Asn116BitCharString *bstring, Asn116BitCharString *compBstring, char *errBuff, OSSIZE errBuffSize)

The rtCmp16BitCharStr function compares two ASN.1 16-bit character string values (including BMPString).

Table 2.55. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
bstring	The pointer to the first 16-bit character string structure to compare.
compBstring	The pointer to the second 16-bit character string structure to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.

errBuffSize	The size of the errBuff buffer.
-------------	---------------------------------

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmp32BitCharStr (const char *name, Asn132BitCharString *bstring, Asn132BitCharString *compBstring, char *errBuff, OSSIZE errBuffSize)

The rtCmp32BitCharStr function compares two 32-bit character string values (including UniversalString).

Table 2.56. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
bstring	The pointer to the first 32-bit character string structure to compare.
compBstring	The pointer to the second 32-bit character string structure to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpReal (const char *name, OSREAL value, OSREAL compValue, char *errBuff, OSSIZE errBuffSize)

The rtCmpReal function compares two ASN.1 REAL values.

Table 2.57. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
value	First value to compare.
compValue	Second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOIDValue (const char *name, ASN1OBJID *pOID, ASN1OBJID *pcompOID, char *errBuff, OSSIZE errBuffSize)

The rtCmpOIDValue function compares two ASN.1 OBJECT IDENTIFIER or REALTIVE-OID values.

Table 2.58. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
------	--

pOID	The pointer to the first value to compare.
pcompOID	The pointer to the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOID64Value (const char *name, ASN1OID64 *pOID, ASN1OID64 *pcompOID, char *errBuff, OSSIZE errBuffSize)

The rtCmpOID64Value function compares two 64-bit ASN.1 OBJECT IDENTIFIER or RELATIVE-OID values.

Table 2.59. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
pOID	The pointer to the first value to compare.
pcompOID	The pointer to the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOpenType (const char *name, OSSIZE numocts, const OSOCTET *data, OSSIZE compNumocts, const OSOCTET *compData, char *errBuff, OSSIZE errBuffSize)

The rtCmpOpenType function compares two ASN.1 values of the old (pre- 1994) ASN.1 ANY type or other elements defined in the later standards to be Open Types (for example, a variable type declaration in a CLASS construct defined in X.681).

Table 2.60. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
numocts	The number of octets in the first value to compare.
data	The pointer to the data of the first value to compare.
compNumocts	The number of octets in the second value to compare.
compData	The pointer to the data of the second value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOpenTypeExt (const char *name, OSRTDList *pElemList, OSRTDList *pCompElemList, char *errBuff, OSSIZE errBuffSize)

The rtCmpOpenTypeExt function compares two ASN.1 open type extension values.

An open type extension is defined as an extensibility marker on a constructed type without any extension elements defined (for example, SEQUENCE {a INTEGER, ...}). The difference is that this is an implicit field that can span one or more elements whereas the standard Open Type is assumed to be a single tagged field.

Table 2.61. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
pElemList	The first pointer to a linked list structure. The list should consist of ASN1OpenType elements.
pCompElemList	The second pointer to a linked list structure. The list should consist of ASN1OpenType elements.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpTag (const char *name, int tag, int compTag, char *errBuff, OSSIZE errBuffSize)

The rtCmpTag function compares two ASN.1 tag values. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.62. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
tag	First tag value to compare.
compTag	Second tag value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpSeqOfElements (const char *name, OSSIZE noOfElems, OSSIZE compNoOfElems, char *errBuff, OSSIZE errBuffSize)

This function compares two ASN.1 SEQUENCE OF sizes. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.63. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
noOfElems	First size value to compare.
compNoOfElems	Second size value to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

OSBOOL rtCmpOptional (const char *name, unsigned presentBit, unsigned compPresentBit, char *errBuff, OSSIZE errBuffSize)

The rtCmpOptional function compares two ASN.1 OPTIONAL bits. The return value is TRUE (matched) or FALSE (unmatched).

Table 2.64. Parameters

name	The name of value. Used for constructing errBuff if values are not matching.
presentBit	First bit to compare.
compPresentBit	Second bit to compare.
errBuff	The pointer to the buffer to receive the null-terminated string if the comparison fails. If the comparison failed, this buffer will contain the null-terminated string that explains the reason of comparison failure.
errBuffSize	The size of the errBuff buffer.

Returns: . The comparison result. TRUE, if values matched, otherwise FALSE.

Macro Definition Documentation

#define rtCmpOID

For backwards compatibility, we define rtCmpOID to be the same as rtCmpOIDValue.

Definition at line 421 of file rtCompare.h

The Documentation for this define was generated from the following file:

- rtCompare.h

#define rtCmpOID64

For backwards compatibility, we define rtCmpOID64 to be the same as rtCmpOID64Value.

Comparison to Standard Output Functions

Detailed Description

cmp

The `rtCmpToStdout<type>` functions do the same actions as the `rtCmp<type>` ones, but they print the comparison results to stdout instead of putting it into the buffer. The prototypes of these functions are almost the same as for the `rtCmp<type>` except the last two parameters - they re absent in the `rtCmpToStdout<type>` functions.

Functions

- OSBOOL `rtCmpToStdoutBoolean` (const char * name, OSBOOL value, OSBOOL compValue)
- OSBOOL `rtCmpToStdoutInteger` (const char * name, OSINT32 value, OSINT32 compValue)
- OSBOOL `rtCmpToStdoutInt64` (const char * name, OSINT64 value, OSINT64 compValue)
- OSBOOL `rtCmpToStdoutUnsigned` (const char * name, OSUINT32 value, OSUINT32 compValue)
- OSBOOL `rtCmpToStdoutUInt64` (const char * name, OSUINT64 value, OSUINT64 compValue)
- OSBOOL `rtCmpToStdoutBitStr` (const char * name, OSSIZE numbits, const OSOCTET * data, OSSIZE compNumbits, const OSOCTET * compData)
- OSBOOL `rtCmpToStdoutOctStr` (const char * name, OSSIZE numocts, const OSOCTET * data, OSSIZE compNumocts, const OSOCTET * compData)
- OSBOOL `rtCmpToStdoutCharStr` (const char * name, const char * cstring, const char * compCstring)
- OSBOOL `rtCmpToStdout16BitCharStr` (const char * name, Asn116BitCharString * bstring, Asn116BitCharString * compBstring)
- OSBOOL `rtCmpToStdout32BitCharStr` (const char * name, Asn132BitCharString * bstring, Asn132BitCharString * compBstring)
- OSBOOL `rtCmpToStdoutReal` (const char * name, OSREAL value, OSREAL compValue)
- OSBOOL `rtCmpToStdoutOID` (const char * name, ASN1OBJID * pOID, ASN1OBJID * pcompOID)
- OSBOOL `rtCmpToStdoutOIDValue` (const char * name, ASN1OBJID * pOID, ASN1OBJID * pcompOID)
- OSBOOL `rtCmpToStdoutOID64` (const char * name, ASN1OID64 * pOID, ASN1OID64 * pcompOID)
- OSBOOL `rtCmpToStdoutOID64Value` (const char * name, ASN1OID64 * pOID, ASN1OID64 * pcompOID)
- OSBOOL `rtCmpToStdoutOpenType` (const char * name, OSSIZE numocts, const OSOCTET * data, OSSIZE compNumocts, const OSOCTET * compData)
- OSBOOL `rtCmpToStdoutOpenTypeExt` (const char * name, OSRTDList * pElemList, OSRTDList * pCompElemList)

- OSBOOL rtCmpToStdoutTag (const char * name, int tag, int compTag)
- OSBOOL rtCmpToStdoutSeqOfElements (const char * name, OSSIZE noOfElems, OSSIZE compNoOfElems)
- OSBOOL rtCmpToStdoutOptional (const char * name, unsigned presentBit, unsigned compPresentBit)

Function Documentation

OSBOOL rtCmpToStdoutBoolean (const char *name, OSBOOL value, OSBOOL compValue)

Table 2.65. Parameters

name	The name of value.
value	The first value to compare.
compValue	The second value to compare.

OSBOOL rtCmpToStdoutInteger (const char *name, OSINT32 value, OSINT32 compValue)

Table 2.66. Parameters

name	The name of value.
value	The first value to compare.
compValue	The second value to compare.

OSBOOL rtCmpToStdoutInt64 (const char *name, OSINT64 value, OSINT64 compValue)

Table 2.67. Parameters

name	The name of value.
value	The first value to compare.
compValue	The second value to compare.

OSBOOL rtCmpToStdoutUnsigned (const char *name, OSUINT32 value, OSUINT32 compValue)

Table 2.68. Parameters

name	The name of value.
value	The first value to compare.

compValue	The second value to compare.
-----------	------------------------------

OSBOOL rtCmpToStdoutUInt64 (const char *name, OSUINT64 value, OSUINT64 compValue)

Table 2.69. Parameters

name	The name of value.
value	The first value to compare.
compValue	The second value to compare.

OSBOOL rtCmpToStdoutBitStr (const char *name, OSSIZE numbits, const OSOCTET *data, OSSIZE compNumbits, const OSOCTET *compData)

Table 2.70. Parameters

name	The name of value.
numbits	The first value to compare.
data	The pointer to the first value.
compNumbits	The second value to compare.
compData	The pointer to the second value.

OSBOOL rtCmpToStdoutOctStr (const char *name, OSSIZE numocts, const OSOCTET *data, OSSIZE compNumocts, const OSOCTET *compData)

Table 2.71. Parameters

name	The name of value.
numocts	The first value to compare.
data	The pointer to the data of the first value.
compNumocts	The second value to compare.
compData	The pointer to the data of the second value.

OSBOOL rtCmpToStdoutCharStr (const char *name, const char *cstring, const char *compCString)

Table 2.72. Parameters

name	The name of value.
cstring	The first value to compare.

compCstring	The second value to compare.
-------------	------------------------------

OSBOOL rtCmpToStdout16BitCharStr (const char *name, Asn116BitCharString *bstring, Asn116BitCharString *compBstring)

Table 2.73. Parameters

name	The name of value.
bstring	The first value to compare.
compBstring	The second value to compare.

OSBOOL rtCmpToStdout32BitCharStr (const char *name, Asn132BitCharString *bstring, Asn132BitCharString *compBstring)

Table 2.74. Parameters

name	The name of value.
bstring	The first value to compare.
compBstring	The second value to compare.

OSBOOL rtCmpToStdoutReal (const char *name, OSREAL value, OSREAL compValue)

Table 2.75. Parameters

name	The name of value.
value	The first value to compare.
compValue	The second value to compare.

OSBOOL rtCmpToStdoutOID (const char *name, ASN1OBJID *pOID, ASN1OBJID *pcompOID)

Table 2.76. Parameters

name	The name of value.
pOID	The first value to compare.
pcompOID	The second value to compare.

OSBOOL rtCmpToStdoutOIDValue (const char *name, ASN1OBJID *pOID, ASN1OBJID *pcompOID)

Table 2.77. Parameters

name	The name of value.
pOID	The first value to compare.
pcompOID	The second value to compare.

OSBOOL rtCmpToStdoutOID64 (const char *name, ASN1OID64 *pOID, ASN1OID64 *pcompOID)

Table 2.78. Parameters

name	The name of value.
pOID	The first value to compare.
pcompOID	The second value to compare.

OSBOOL rtCmpToStdoutOID64Value (const char *name, ASN1OID64 *pOID, ASN1OID64 *pcompOID)

Table 2.79. Parameters

name	The name of value.
pOID	The first value to compare.
pcompOID	The second value to compare.

OSBOOL rtCmpToStdoutOpenType (const char *name, OSSIZE numocts, const OSOCTET *data, OSSIZE compNumocts, const OSOCTET *compData)

Table 2.80. Parameters

name	The name of value.
numocts	The number of octets in the first value to compare.
data	The pointer to the data in the first value to compare.
compNumocts	The number of octets in the second value to compare.
compData	The pointer to the data in the second value to compare.

OSBOOL rtCmpToStdoutOpenTypeExt (const char *name, OSRTDList *pElemList, OSRTDList *pCompElemList)

Table 2.81. Parameters

name	The name of value.
------	--------------------

pElemList	The first value to compare.
pCompElemList	The second value to compare.

OSBOOL rtCmpToStdoutTag (const char *name, int tag, int compTag)

Table 2.82. Parameters

name	The name of value.
tag	The first value to compare.
compTag	The second value to compare.

OSBOOL rtCmpToStdoutSeqOfElements (const char *name, OSSIZE noOfElems, OSSIZE compNoOfElems)

Table 2.83. Parameters

name	The name of value.
noOfElems	The first value to compare.
compNoOfElems	The second value to compare.

OSBOOL rtCmpToStdoutOptional (const char *name, unsigned presentBit, unsigned compPresentBit)

Table 2.84. Parameters

name	The name of value.
presentBit	The first value to compare.
compPresentBit	The second value to compare.

Copy Functions

Detailed Description

This group of functions allows copying values of primitive ASN.1 types.

These functions are used in copy routines that are generated by the ASN.1 compiler when *-gencopy* option is used. Some primitive types that are mapped onto C standard primitive types (such as BOOLEAN, INTEGER REAL) do not need copy functions. The standard assignment operator can be used to copy these types.

Functions

- OSBOOL rtCopyBitStr64 (OSSIZE srcNumbits, const OSOCTET * pSrcData, OSSIZE * pDstNumbits, OSOCTET * pDstData, OSSIZE dstDataSize)

- OSBOOL rtCopyBitStr (OSUINT32 srcNumbits, const OSOCTET * pSrcData, OSUINT32 * pDstNumbits, OSOCTET * pDstData)
- OSBOOL rtCopyDynBitStr64 (OSCTXT * pctxt, const ASN1DynBitStr64 * pSrcData, ASN1DynBitStr64 * pDstData)
- OSBOOL rtCopyDynBitStr (OSCTXT * pctxt, const ASN1DynBitStr * pSrcData, ASN1DynBitStr * pDstData)
- OSBOOL rtCopyOctStr64 (OSSIZE srcNumocts, const OSOCTET * pSrcData, OSSIZE * pDstNumocts, OSOCTET * pDstData, OSSIZE dstDataSize)
- OSBOOL rtCopyOctStr (OSUINT32 srcNumocts, const OSOCTET * pSrcData, OSUINT32 * pDstNumocts, OSOCTET * pDstData)
- OSBOOL rtCopyDynOctStr64 (OSCTXT * pctxt, const OSDynOctStr64 * pSrcData, OSDynOctStr64 * pDstData)
- OSBOOL rtCopyDynOctStr (OSCTXT * pctxt, const ASN1DynOctStr * pSrcData, ASN1DynOctStr * pDstData)
- OSBOOL rtCopyCharStr (OSCTXT * pctxt, const char * srcStr, char ** dstStr)
- OSBOOL rtCopy16BitCharStr (OSCTXT * pctxt, const Asn116BitCharString * srcStr, Asn116BitCharString * dstStr)
- OSBOOL rtCopy32BitCharStr (OSCTXT * pctxt, const Asn132BitCharString * srcStr, Asn132BitCharString * dstStr)
- OSBOOL rtCopyOID (const ASN1OBJID * srcOID, ASN1OBJID * dstOID)
- OSBOOL rtCopyOID64 (const ASN1OID64 * srcOID, ASN1OID64 * dstOID)
- OSBOOL rtCopyOpenType (OSCTXT * pctxt, const ASN1OpenType * srcOT, ASN1OpenType * dstOT)
- OSBOOL rtCopyOpenTypeExt (OSCTXT * pctxt, const OSRTDList * srcList, OSRTDList * dstList)

Function Documentation

OSBOOL rtCopyBitStr64 (OSSIZE srcNumbits, const OSOCTET *pSrcData, OSSIZE *pDstNumbits, OSOCTET *pDstData, OSSIZE dstDataSize)

The rtCopyBitStr64 function copies one ASN.1 BIT STRING value to another. This function is safe fo use in 64-bit environments.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.85. Parameters

srcNumbits	The number of bits in the source value to copy.
pSrcData	The pointer to data of the source value to copy.
pDstNumbits	The pointer to destination number of bits. The srcNumbits argument will be copied into it.
pDstData	The pointer to the destination buffer to receive the copied data. The buffer is assumed to be already allocated or static and should be enough to receive the copying data.
dstDataSize	Size of destination data static buffer.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyBitStr (OSUINT32 srcNumbits, const OSOCTET *pSrcData, OSUINT32 *pDstNumbits, OSOCTET *pDstData)

The rtCopyBitStr function copies one ASN.1 BIT STRING value to another.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

This function is deprecated and considered to be unsafe because the size of the destination buffer is not specified. It exists for backward compatibility with previous versions only.

Table 2.86. Parameters

srcNumbits	The number of bits in the source value to copy.
pSrcData	The pointer to data of the source value to copy.
pDstNumbits	The pointer to destination number of bits. The srcNumbits argument will be copied into it.
pDstData	The pointer to the destination buffer to receive the copied data. The buffer is assumed to be already allocated or static and should be enough to receive the copying data.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyDynBitStr64 (OSCTXT *pctxt, const ASN1DynBitStr64 *pSrcData, ASN1DynBitStr64 *pDstData)

The rtCopyDynBitStr64 function is similar to the rtCopyBitStr64, but it copies a dynamic ASN.1 BIT STRING value.

The return vale is one of the TRUE (copied successfully) or FALSE (error has occurred).

This function is safe for use in 64-bit environments.

Table 2.87. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pSrcData	The pointer to data of the source value to copy.
pDstData	The pointer to the destination dynamic bit string structure to receive the copied data. The memory will be allocated dynamically via call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyDynBitStr (OSCTXT *pctxt, const ASN1DynBitStr *pSrcData, ASN1DynBitStr *pDstData)

The rtCopyDynBitStr function is similar to the rtCopyBitStr, but it copies a dynamic ASN.1 BIT STRING value.

The return vale is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.88. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pSrcData	The pointer to data of the source value to copy.
pDstData	The pointer to the destination dynamic bit string structure to receive the copied data. The memory will be allocated dynamically via call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOctStr64 (OSSIZE srcNumocts, const OSOCTET *pSrcData, OSSIZE *pDstNumocts, OSOCTET *pDstData, OSSIZE dstDataSize)

The rtCopyOctStr function copies one ASN.1 OCTET STRING value to another. This function is safe fo use in 64-bit environments.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.89. Parameters

srcNumocts	The number of octets in the source value to copy.
pSrcData	The pointer to data of the source value to copy.
pDstNumocts	The pointer to the destination number of octets. The srcNumocts argument will be copied into it.
pDstData	The pointer to the destination buffer to receive the copied data. The buffer is assumed to be already allocated or static and should be enough to receive the copying data.
dstDataSize	Size of destination data static buffer.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOctStr (OSUINT32 srcNumocts, const OSOCTET *pSrcData, OSUINT32 *pDstNumocts, OSOCTET *pDstData)

The rtCopyOctStr function copies one ASN.1 OCTET STRING value to another.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

This function is deprecated and considered to be unsafe because the size of the destination buffer is not specified. It exists for backward compatibility with previous versions only.

Table 2.90. Parameters

srcNumocts	The number of octets in the source value to copy.
pSrcData	The pointer to data of the source value to copy.
pDstNumocts	The pointer to the destination number of octets. The srcNumocts argument will be copied into it.

pDstData	The pointer to the destination buffer to receive the copied data. The buffer is assumed to be already allocated or static and should be enough to receive the copying data.
----------	---

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyDynOctStr64 (OSCTXT *pctx, const OSDynOctStr64 *pSrcData, OSDynOctStr64 *pDstData)

The rtCopyDynOctStr function is similar to rtCopyOctStr, but it copies a dynamic ASN.1 OCTET STRING value.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

This function is safe for use in 64-bit environments.

Table 2.91. Parameters

pctx	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pSrcData	The pointer to the source dynamic octet string structure to copy.
pDstData	The point to destination dynamic octet string structure to receive the copied data. The memory will be allocated dynamically via a call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyDynOctStr (OSCTXT *pctx, const ASN1DynOctStr *pSrcData, ASN1DynOctStr *pDstData)

The rtCopyDynOctStr function is similar to rtCopyOctStr, but it copies a dynamic ASN.1 OCTET STRING value.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.92. Parameters

pctx	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pSrcData	The pointer to the source dynamic octet string structure to copy.
pDstData	The point to destination dynamic octet string structure to receive the copied data. The memory will be allocated dynamically via a call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyCharStr (OSCTXT *pctx, const char *srcStr, char **dstStr)

The rtCopyCharStr function copies one ASN.1 8-bit character string value to another (including IA5String, VisibleString, PrintableString, NumericString, etc).

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.93. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
srcStr	The pointer to the source standard null-terminated string to copy.
dstStr	The pointer to pointer destination string to receive the copied string. The memory will be allocated dynamically via a call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopy16BitCharStr (OSCTXT *pctxt, const Asn116BitCharString *srcStr, Asn116BitCharString *dstStr)

The rtCopy16BitCharStr function copies one ASN.1 16-bit character string value to another (generally BMPString).

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.94. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
srcStr	The pointer to the source 16-bit character string structure to copy.
dstStr	The pointer to destination 16-bit character string structure to receive the copied string. The memory will be allocated dynamically via call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopy32BitCharStr (OSCTXT *pctxt, const Asn132BitCharString *srcStr, Asn132BitCharString *dstStr)

The rtCopy32BitCharStr function copies one ASN.1 32-bit character string value to another (generally UniversalString).

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.95. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
srcStr	The pointer to the source 32-bit character string structure to copy.
dstStr	The pointer to destination 32-bit character string structure to receive the copied string. The memory will be allocated dynamically via call to rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOID (const ASN1OBJID *srcOID, ASN1OBJID *dstOID)

The rtCopyIOD function copies one ASN.1 OBJECT IDENTIFIER or RELATED-IOD value to another.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.96. Parameters

srcOID	The pointer to the source object identifier structure to copy.
dstOID	The pointer to destination structure t receive the copied string.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOID64 (const ASN1OID64 *srcOID, ASN1OID64 *dstOID)

The rtCopyOID64 function copies one 64-bit ASN.1 OBJECT IDENTIFIER or RELATIVE-OID value to another.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.97. Parameters

srcOID	The pointer to the source object identifier structure to copy.
dstOID	The pointer to destination structure t receive the copied string.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOpenType (OSCTXT *pctxt, const ASN1OpenType *srcOT, ASN1OpenType *dstOT)

The rtCopyOpenType copies ASN.1 value of the old (pre- 1994) ASN.1 ANY type or other elements defined in the later standards to be Open Types (for example, a variable type declaration in a CLASS construct as defined in X.681).

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred).

Table 2.98. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
srcOT	The pointer to the source Open Type structure to copy.
dstOT	The pointer to the destination Open Type structure to receive the copied data. The memory will be allocated dynamically via call to the rtxMemAlloc function.

Returns: . The copying result. TRUE, if success, otherwise FALSE.

OSBOOL rtCopyOpenTypeExt (OSCTXT *pctxt, const OSRTDList *srcList, OSRTDList *dstList)

The rtCopyOpenTypeExt function copies an ASN.1 open type extension value.

The return value is one of the TRUE (copied successfully) or FALSE (error has occurred). An open type extension is defined as extensibility marker on a constructed type without any extension elements defined (for example, SE-

QUENCE { a INTEGER, ... }). The difference is that this is an implicit field that can span more elements whereas the standard Open Type is assumed to be a single tagged field.

Table 2.99. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
srcList	The pointer to the source linked list structure to copy. The list should consist of ASN1OpenType elements.
dstList	The pointer to destination linked list structure to receive the copied data. The memory for list nodes and data will be allocated dynamically via call to the rtxMemAlloc function. The list nodes will contain the data of ASN1OpenType type.

Context Message Buffer Read/Write Functions

Detailed Description

The context message buffer can be written to, or read from, using various functions.

Classes

- struct _OSRTBufLocDescr

Typedef Documentation

`typedef struct _OSRTBufLocDescr OSRTBufLocDescr`

Buffer location descriptor

Function Documentation

`int rtxCheckOutputBuffer (OSCTXT *pctxt, size_t nbytes)`

This function checks to ensure that the output buffer has sufficient space to hold an additional `nbytes` full bytes (if there is a partially filled byte, it is treated as though full). Dynamic buffers are resized if the check fails, while static buffers induce a buffer overflow error. This function may return `RTERR_NOMEM` if reallocating the dynamic buffer fails.

Table 2.100. Parameters

<code>pctxt</code>	Pointer to a context structure.
<code>nbytes</code>	The requested capacity for the buffer.

Returns: . 0 on success, or less than zero on failure.

`OSBOOL rtxIsOutputBufferFlushable (OSCTXT *pctxt)`

This function returns true if the context buffer can be flushed to a stream by calling `rtxFlushOutputBuffer`. This function is used to determine whether it is safe to call `rtxFlushOutputBuffer`.

Table 2.101. Parameters

<code>pctxt</code>	Pointer to a context structure.
--------------------	---------------------------------

Returns: . TRUE if the buffer can be flushed; FALSE is not.

int rtxFlushOutputBuffer (OSCTXT *pctxt)

This function flushes the buffer to a stream. This function MUST only be called if rtxIsOutputBufferFlushable(pctxt) returns TRUE; the behavior is otherwise undefined. After a successful call, pctxt->buffer.byteIndex == 0. Note that pctxt->buffer.bitOffset is not changed - if there was a partial byte in the buffer before this call, there will be a partial by afterward.

Table 2.102. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . 0 on success, or less than zero on failure.

int rtxExpandOutputBuffer (OSCTXT *pctxt, size_t nbytes)

This function attempts to ensure the output buffer has at least the given number of bytes available. A partially full byte in the buffer counts as being available. Dynamic buffers are resized, if necessary, while static buffers induce a buffer overflow error. This function may return RTERR_NOMEM if reallocating a dynamic buffer fails.

Table 2.103. Parameters

pctxt	Pointer to a context structure.
nbytes	The requested capacity for the buffer.

Returns: . 0 on success, or less than zero on failure.

int rtxCheckInputBuffer (OSCTXT *pctxt, size_t nbytes)

Ensures the given number of bytes are available in the context buffer.

If a stream is attached to the context and is being buffered by the context buffer, this may read from the stream to fill the buffer. Thus this function may alter the context buffer byteIndex and size. Any bytes read from the stream will be sent to the capture buffer, if there is one.

Returns: . 0 on success, or less than zero on failure. RTERR_ENDOFBUF or RTERR_ENDOFFILE (depending on whether the source is a stream or not) is returned if the requested number of bytes are not available in the input.

int rtxLoadInputBuffer (OSCTXT *pctxt, OSSIZE nbytes)

This is for meant for internal use by the runtime.

Read at least as many bytes from the context's input stream into the context buffer as necessary to make nbytes of data available in the context buffer.

Upon return, pctxt.buffer.byteIndex + nbytes <= pctxt.buffer.size OR EOF has been reached OR an error has been logged and is being returned.

If the context buffer has not been created, this will create it. If the context buffer needs to be made larger, this will enlarge it or else log, and return, an error.

Table 2.104. Parameters

pctxt	A context with an attached stream using the context's buffer as a buffer for the stream.
-------	--

Returns: . 0 or or negative error. EOF is not considered an error.

int rtxPeekByte (OSCTXT *pctxt, OSOCTET *pbyte)

This function peeks at the next byte of input, if there is one before EOF. A return of 1 ensures the peeked byte can be skipped by incrementing pctxt->buffer.byteIndex.

Table 2.105. Parameters

pbyte	Receives the value of the peeked byte.
-------	--

Returns: . 0 if there was no byte to peek at. 1 if there was a byte to peek at. <0 if there was an error.

int rtxPeekBytes (OSCTXT *pctxt, OSOCTET *pdata, OSSIZE bufsize, OSSIZE nocts, OSSIZE *pactual)

This function peeks at the next nocts bytes of input, peeking at fewer bytes if EOF is encountered first. A returned value (in *pactual) of n (>=0) ensures that n (or fewer) peeked bytes can be skipped by adding n (or less) to pctxt->buffer.byteIndex.

Table 2.106. Parameters

pdata	Receives the value of the peeked bytes.
bufsize	Size of pdata. If less than nocts, nocts will be adjusted accordingly.
nocts	The number of bytes to peek.
pactual	Receives the actual number of bytes peeked.

Returns: . 0 for success <0 if there was an error.

int rtxReadBytesSafe (OSCTXT *pctxt, OSOCTET *buffer, size_t bufsize, size_t nocts)

This function safely reads bytes from the currently open stream or memory buffer into the given static buffer. This function is preferred over rtxReadBytes because it will detect buffer overflow.

Table 2.107. Parameters

pctxt	Pointer to a context structure.
buffer	Static buffer into which bytes are to be read.

bufsize	Size of the static buffer.
nocts	Number of bytes (octets) to read.

Returns: . Status of the operation: 0 if success, negative value if error.

int rtxReadBytes (OSCTXT *pctxt, OSOCTET *pdata, size_t nocts)

This function reads bytes from the currently open stream or memory buffer.

Table 2.108. Parameters

pctxt	Pointer to a context structure.
pdata	Pointer to byte array where bytes are to be copied.
nocts	Number of bytes (octets) to read.

Returns: . Status of the operation: 0 if success, negative value if error.

int rtxReadBytesDynamic (OSCTXT *pctxt, OSOCTET **ppdata, size_t nocts, OSBOOL *pMemAlloc)

This function reads bytes from the currently open stream or memory buffer. In this case the function MAY allocate memory to hold the read bytes. It will only do this if the requested number of bytes will not fit in the context buffer; otherwise, a pointer to a location in the context buffer is returned. If memory was allocated, it should be freed using rtxMemFreePtr.

Table 2.109. Parameters

pctxt	Pointer to a context structure.
ppdata	Pointer to byte buffer pointer.
nocts	Number of bytes (octets) to read.
pMemAlloc	Pointer to boolean value which is set to true if memory was allocated to hold requested bytes.

Returns: . Status of the operation: 0 if success, negative value if error.

int rtxWriteBytes (OSCTXT *pctxt, const OSOCTET *pdata, size_t nocts)

This function writes bytes to the currently open stream or memory buffer.

Table 2.110. Parameters

pctxt	Pointer to a context structure.
pdata	Pointer to location where bytes are to be copied.

nocts	Number of bytes to read.
-------	--------------------------

Returns: . I/O byte count.

int rtxWriteIndent (OSCTXT *pctx)

This function writes a newline followed by indentation whitespace to the buffer. The amount of indentation to add is determined by the indent member variable in the context structure.

If context flag OSNOWHITESPACE is set, this function will do nothing.

Table 2.111. Parameters

pctx	Pointer to context block structure.
------	-------------------------------------

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

void rtxIndentDecr (OSCTXT *pctx)

This decreases the indentation level set in the given context by updating the indent member.

See also: . rtxGetIndentLevels

Table 2.112. Parameters

pctx	Pointer to context block structure.
------	-------------------------------------

void rtxIndentIncr (OSCTXT *pctx)

This increases the indentation level set in the given context by updating the indent member.

See also: . rtxGetIndentLevels

Table 2.113. Parameters

pctx	Pointer to context block structure.
------	-------------------------------------

void rtxIndentReset (OSCTXT *pctx)

This resets the indentation level in the given context to zero.

See also: . rtxGetIndentLevels

Table 2.114. Parameters

pctxt	Pointer to context block structure.
-------	-------------------------------------

size_t rtxGetIndentLevels (OSCTXT *pctxt)

This returns the number of levels of indentation set in the given context. Currently, the indentation level in the context affects rtxPrintToStreamIndent (when used with a non-null OSCTXT), rtxWriteIndent, and rtJsonEncIndent, meaning it currently affects print-to-stream output, Abstract Syntax Notation output, and JSON (JER) output.

Table 2.115. Parameters

pctxt	Pointer to context block structure.
-------	-------------------------------------

OSBOOL rtxCanonicalSort (OSOCTET *refPoint, OSRTSList *pList, OSBOOL normal)

Sort a list of buffer locations, referring to component encodings, by comparing the referenced encodings as octet strings.

The sorting can be used with canonical-BER (CER), distinguished-BER (DER), and canonical-XER (XER).

Encoding into the buffer may be done as a normal encoding (start to end) or as a reverse encoding (end to start). This affects the parameters as described below.

Table 2.116. Parameters

refPoint	Reference point in the buffer for the buffer locations. For normal encoding, refPoint is the start of the buffer; for reverse encoding, refPoint is the end of the buffer.
pList	List of OSRTBufLocDescr, each of which locates the start of an encoded component. The offsets for the locations are relative to refPoint. If normal is TRUE, this function orders the list from least to greatest. Otherwise, it is ordered from greatest to least.
normal	TRUE for normal encoding; FALSE for reverse encoding. This tells the function whether to add or subtract offsets from refPoint to locate the component encodings and also how to order the list.

Returns: . TRUE if any changes to pList were made; FALSE otherwise (meaning the list was already in the desired order).

int rtxEncCanonicalSort (OSCTXT *pctxt, OSCTXT *pMemCtxt, OSRTSList *pList)

Encode the encodings held in pMemCtxt into pctxt, first sorting them as required for canonical BER (and other encoding rules) by X.690 11.6.

Table 2.117. Parameters

pctxt	Pointer to context structure into which the sorted encodings should be encoded.
-------	---

pMemCtxt	Pointer to context structure which holds the unsorted encodings.
pList	List of Asn1BufLocDescr, each of which locates an encoding in pMemCtxt's buffer, the whole being the encodings that are to be sorted.

void rtxGetBufLocDescr (OSCTXT *pctxt, OSRTBufLocDescr *pDescr)

Set the buffer location description's offset (pDescr->offset) to the current position in pCtxt's buffer.

void rtxAddBufLocDescr (OSCTXT *pctxt, OSRTSList *pElemList, OSRTBufLocDescr *pDescr)

Create a new Asn1BufLocDescr for an element just encoded and append it to pElemList.

Table 2.118. Parameters

pctxt	Pointer to context where data has been encoded.
pElemList	List of Asn1BufLocDescr to which a new entry will be added.
pDescr	Pointer to Asn1BufLocDescr whose offset indicates the start of the element just encoded. The new Asn1BufLocDescr that is added will have the same offset and will have numocts determined by this offset and pctxt's current buffer position.

Binary Coded Decimal (BCD) Helper Functions

Detailed Description

Binary Coded Decimal (BCD) helper functions provide assistance in working with BCD numbers. Functions are provided to convert to a BCD values to and from string form.

Functions

- const char * rtBCDToString (OSSIZE numocts, const OSOCTET * data, char * buffer, size_t bufsiz, OSBOOL isTBCD)
- int rtStringToBCD (const char * str, OSOCTET * bcdStr, size_t bufsiz, OSBOOL isTBCD)
- int rtStringToDynBCD (OSCTXT * pctxt, const char * str, ASN1DynOctStr * poctstr)
- int rtStringToDynBCD64 (OSCTXT * pctxt, const char * str, OSDynOctStr64 * poctstr, OSBOOL isTBCD)
- int rtStringToTBCD (const char * str, OSOCTET * bcdStr, size_t bufsiz)
- const char * rtTBCDToString (OSSIZE numocts, const OSOCTET * data, char * buffer, size_t bufsiz)

Macros

- #define rtQ825TBCDToString rtxQ825TBCDToString(numocts, data, buffer, bufsiz)

- #define rtDecQ825TBCDString rtxDecQ825TBCDString(pctxt, numocts, buffer, bufsiz)
- #define rtEncQ825TBCDString rtxEncQ825TBCDString(pctxt, str)
- #define rtTBCDBinToChar rtxTBCDBinToChar(bcdDigit, pdigit)
- #define rtTBCDCharToBin rtxTBCDCharToBin(digit, pbyte)

Function Documentation

const char* rtBCDToString (OSSIZE numocts, const OSOCTET *data, char *buffer, size_t bufsiz, OSBOOL isTBCD)

This function converts a packed BCD value to a standard null-terminated string. Octet values may contain filler digits if the number of BCD digits is odd.

BCD digits can be 0(0000) to 9(1001). Filler digits can be A(1010), B(1011), C(1100), D(1101), E(1110) or F(1111)

Table 2.119. Parameters

numocts	The number of octets in the BCD value.
data	The pointer to the BCD value.
buffer	The destination buffer. Should not be less than bufsiz argument is.
bufsiz	The size of the destination buffer (in octets). The buffer size should be atleast ((numocts * 2) + 1) to hold the BCD to String conversion.
isTBCD	Whether the input data is formatted as a TBCD string or not.

Returns: . The converted null-terminated string. NULL, if error has occurred or destination buffer is not enough.

See also: . rtBCDToString

int rtStringToBCD (const char *str, OSOCTET *bcdStr, size_t bufsiz, OSBOOL isTBCD)

This function converts a standard null-terminated string into a BCD value. The source string should contain only characters '0' - '9', 'A' - 'F', or 'a' - 'f'. Otherwise, an error will occur.

Table 2.120. Parameters

str	The source standard null-terminated string.
bcdStr	The destination buffer. Should not be less than bufsiz is.
bufsiz	The size of the destination buffer (in octets).
isTBCD	Whether the string is a TBCD string or not.

Returns: . The number of octets in the resulting BCD value or a negative value if an error occurs.

See also: . rtStringToTBCD

int rtStringToDynBCD (OSCTXT *pctxt, const char *str, ASN1DynOctStr *pocstr)

This function converts a standard null-terminated string into a BCD value. The source string should contain only characters '0' - '9', 'A' - 'F', or 'a' - 'f'. Otherwise, an error will occur.

Table 2.121. Parameters

str	The source standard null-terminated string.
pctxt	Pointer to a context structure block.
pocstr	Pointer to a dynamic octet string variable. Memory will be allocated for the data member of this structure with rtMemAlloc.

Returns: . The number of octets in the resulting BCD value or a negative value if an error occurs.

int rtStringToDynBCD64 (OSCTXT *pctxt, const char *str, OSDynOctStr64 *pocstr, OSBOOL isTBCD)

This function converts a standard null-terminated string into a BCD or TBCD value. It is the 64-bit version of rtStringToDynBCD which provides a clean interface to 64-bit size types. However, the maximum size of a string that can be converted is INT_MAX (the size a 32-bit signed integer can hold).

Table 2.122. Parameters

str	The source standard null-terminated string.
pctxt	Pointer to a context structure block.
pocstr	Pointer to a dynamic octet string variable. Memory will be allocated for the data member of this structure with rtMemAlloc.
isTBCD	Whether the input data is formatted as a TBCD string or not.

Returns: . The number of octets in the resulting BCD value or a negative value if an error occurs.

int rtStringToTBCD (const char *str, OSOCTET *bcdStr, size_t bufsiz)

This function converts a standard null-terminated string into a TBCD value. The source string should contain only characters '0' - '9', 'A' - 'F', or 'a' - 'f'. Otherwise, an error will occur. A TBCD string differs from a normal BCD string in that its bytes are flipped. The BCD string 0x12345f would be represented 0x2143f5 as a TBCD string.

Table 2.123. Parameters

str	The source standard null-terminated string.
bcdStr	The destination buffer. Should not be less than bufsiz is.
bufsiz	The size of the destination buffer (in octets).

Returns: . The number of octets in the resulting BCD value or a negative value if an error occurs.

Since: . 6.06

const char* rtTBCDToString (OSSIZE numocts, const OSOCTET *data, char *buffer, size_t bufsiz)

This function converts a packed TBCD value to a standard null-terminated string. Octet value can contain the filler digit to represent the odd number of BCD digits. A TBCD string differs from a normal BCD string in that the byte values of the octets are flipped. The BCD string 0x12345f would be represented 0x2143f5 as a TBCD string.

TBCD digits can be 0(0000) to 9(1001). Filler digits can be A(1010), B(1011), C(1100), D(1101), E(1110) or F(1111)

Table 2.124. Parameters

numocts	The number of octets in the BCD value.
data	The pointer to the BCD value.
buffer	The destination buffer. Should not be less than bufsiz argument is.
bufsiz	The size of the destination buffer (in octets). The buffer size should be atleast ((numocts * 2) + 1) to hold the BCD to String conversion.

Returns: . The converted null-terminated string. NULL, if error has occurred or destination buffer is not enough.

Since: . 6.06

Macro Definition Documentation

#define rtQ825TBCDToString

This function converts a Q.825 TBCD value to a standard null-terminated string. Octet values can contain the filler digit to represent the odd number of BCD digits.

The encoding is as follows per Q.825:

This type (Telephony Binary Coded Decimal String) is used to represent digits from 0 through 9, *, #, a, b, c, two digits per octet, each digit encoded 0000 to 1001 (0 to 9), 1010 (*) 1011(#), 1100 (a), 1101 (b) or 1110 (c); 1111 (end of pulsing signal-ST); 0000 is used as a filler when there is an odd number of digits.

Table 2.125. Parameters

numocts	The number of octets in the BCD value.
data	The pointer to the BCD value.
buffer	The destination buffer. Should not be less than bufsiz argument is.
bufsiz	The size of the destination buffer (in octets). The buffer size should be at least ((numocts * 2) + 1) to hold the BCD to String conversion.

Returns: . Status of conversion: 0 = success, negative = error.

Since: . 6.6

Definition at line 189 of file rtBCD.h

The Documentation for this define was generated from the following file:

- rtBCD.h

#define rtDecQ825TBCDString

This function decodes a Q.825 TBCD value to a standard null-terminated string. TBCD digits are read from the decode buffer/stream and converted to their character equivalents. See 'rtQ825TBCDToString' for a description of the Q.825 TBCD format.

Table 2.126. Parameters

pctxt	Pointer to a context structure block.
numocts	The number of octets in the BCD value to be read from input stream.
buffer	The destination buffer. Should not be less than bufsiz argument is.
bufsiz	The size of the destination buffer (in octets). The buffer size should be at least $((\text{numocts} * 2) + 1)$ to hold the BCD to String conversion.

Returns: . Status of conversion: 0 = success, negative = error.

Since: . 6.6

Definition at line 209 of file rtBCD.h

The Documentation for this define was generated from the following file:

- rtBCD.h

#define rtEncQ825TBCDString

This function encodes a null-terminated string Q.825 TBCD string. TBCD digits are converted and written to the encode buffer/stream. See 'rtQ825TBCDToString' for a description of the Q.825 TBCD format.

Table 2.127. Parameters

pctxt	Pointer to a context structure block.
str	Null-terminate string to be encoded. This string may only contain valid Q.825 TBCD characters.

Returns: . Status of operation: 0 = success, negative = error.

Since: . 6.6

Definition at line 223 of file rtBCD.h

The Documentation for this define was generated from the following file:

- rtBCD.h

#define rtTBCDBinToChar

This function converts a TBCD binary character into its ASCII equivalent.

Table 2.128. Parameters

bcdDigit	TBCD digit
pdigit	Pointer to character to receive converted character

Returns: . 0 if conversion successful, or negative error code

Since: . 6.6

Definition at line 234 of file rtBCD.h

The Documentation for this define was generated from the following file:

- rtBCD.h

#define rtTBCDCharToBin

This function converts a TBCD character ('0'-'9','*#abc") into its binary equivalent.

Table 2.129. Parameters

digit	TBCD digit character ('0'-'9','*#abc")
pbyte	Pointer to byte to receive binary result.

Returns: . 0 if conversion successful, or negative error code

Since: . 6.6

Definition at line 245 of file rtBCD.h

The Documentation for this define was generated from the following file:

Character string functions

Detailed Description

These functions are more secure versions of several of the character string functions available in the standard C runtime library.

Functions

- int rtxStricmp (const char * str1, const char * str2)
- int rtxStrnicmp (const char * str1, const char * str2, size_t count)

- `char * rtxStrcat (char * dest, size_t bufsiz, const char * src)`
- `char * rtxStrncat (char * dest, size_t bufsiz, const char * src, size_t nchars)`
- `char * rtxStrcpy (char * dest, size_t bufsiz, const char * src)`
- `char * rtxStrncpy (char * dest, size_t bufsiz, const char * src, size_t nchars)`
- `char * rtxStrdup (OSCTXT * pctxt, const char * src)`
- `char * rtxStrndup (OSCTXT * pctxt, const char * src, OSSIZE nchars)`
- `const char * rtxStrJoin (char * dest, size_t bufsiz, const char * str1, const char * str2, const char * str3, const char * str4, const char * str5)`
- `char * rtxStrDynJoin (OSCTXT * pctxt, const char * str1, const char * str2, const char * str3, const char * str4, const char * str5)`
- `char * rtxStrTrimEnd (char * s)`
- `int rtxValidateConstrainedStr (OSCTXT * pctxt, const char * pvalue, const char * pCharSet)`
- `int rtxIntToCharStr (OSINT32 value, char * dest, size_t bufsiz, char padchar)`
- `int rtxUIntToCharStr (OSUINT32 value, char * dest, size_t bufsiz, char padchar)`
- `int rtxInt64ToCharStr (OSINT64 value, char * dest, size_t bufsiz, char padchar)`
- `int rtxUInt64ToCharStr (OSUINT64 value, char * dest, size_t bufsiz, char padchar)`
- `int rtxSizeToCharStr (size_t value, char * dest, size_t bufsiz, char padchar)`
- `int rtxHexCharsToBinCount (const char * hexstr, size_t nchars)`
- `int rtxHexCharsToBin (const char * hexstr, size_t nchars, OSOCTET * binbuf, size_t bufsiz)`
- `int rtxCharStrToInt (const char * cstr, OSINT32 * pvalue)`
- `int rtxCharStrnToInt (const char * cstr, OSSIZE ndigits, OSINT32 * pvalue)`
- `int rtxCharStrToInt8 (const char * cstr, OSINT8 * pvalue)`
- `int rtxCharStrToInt16 (const char * cstr, OSINT16 * pvalue)`
- `int rtxCharStrToInt64 (const char * cstr, OSINT64 * pvalue)`
- `int rtxCharStrToUInt (const char * cstr, OSUINT32 * pvalue)`
- `int rtxCharStrToUInt8 (const char * cstr, OSUINT8 * pvalue)`
- `int rtxCharStrToUInt16 (const char * cstr, OSUINT16 * pvalue)`
- `int rtxCharStrToUInt64 (const char * cstr, OSUINT64 * pvalue)`

Function Documentation

int rtxStricmp (const char *str1, const char *str2)

This is an implementation of the non-standard stricmp function. It does not check for greater than/less than however, only for equality.

Table 2.130. Parameters

str1	Pointer to first string to compare.
str2	Pointer to second string to compare.

Returns: . 0 if strings are equal, non-zero if not.

int rtxStrnicmp (const char *str1, const char *str2, size_t count)

This is an implementation of the non-standard stricmp function. It does not check for greater than/less than however, only for equality.

Table 2.131. Parameters

str1	Pointer to first string to compare.
str2	Pointer to second string to compare.
count	Number of characters to compare, at most.

Returns: . 0 if strings are equal, non-zero if not.

char* rtxStrcat (char *dest, size_t bufsiz, const char *src)

This function concatenates the given string onto the string buffer. It is similar to the C strcat function except more secure because it checks for buffer overrun.

Table 2.132. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
src	Pointer to null-terminated string to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

char* rtxStrncat (char *dest, size_t bufsiz, const char *src, size_t nchars)

This function concatenates the given number of characters from the given string onto the string buffer. It is similar to the C strncat function except more secure because it checks for buffer overrun.

Table 2.133. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.

src	Pointer to null-terminated string to copy.
nchars	Number of characters to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

char* rtxStrcpy (char *dest, size_t bufsiz, const char *src)

This function copies a null-terminated string to a target buffer. It is similar to the C `strcpy` function except more secure because it checks for buffer overrun.

Table 2.134. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
src	Pointer to null-terminated string to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

char* rtxStrncpy (char *dest, size_t bufsiz, const char *src, size_t nchars)

This function copies the given number of characters from a string to a target buffer. It is similar to the C `strncpy` function except more secure because it checks for buffer overrun and ensures a null-terminator is copied to the end of the target buffer. If the target buffer is too short to hold the null terminator, the last character is overwritten and a null pointer is returned; the destination buffer can still be examined in this case.

Table 2.135. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
src	Pointer to null-terminated string to copy.
nchars	Number of characters to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

char* rtxStrdup (OSCTXT *pctxt, const char *src)

This function creates a duplicate copy of a null-terminated string. Memory is allocated for the target string using the `rtxMemAlloc` function. The string is then copied into this memory block. It is similar to the C `strdup` function except more secure because it checks for buffer overrun.

Table 2.136. Parameters

pctxt	Pointer to a standard context structure.
src	Pointer to null-terminated string to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

char* rtxStrndup (OSCTXT *pctxt, const char *src, OSSIZE nchars)

This function creates a duplicate copy of up to the given number of characters in a string. The string does not need to be null-terminated. Memory is allocated for the target string using the rtxMemAlloc function. The string is then copied into this memory block. It is similar to the C `strndup` function except more secure because it checks for buffer overrun.

Table 2.137. Parameters

pctxt	Pointer to a standard context structure.
src	Pointer to null-terminated string to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

const char* rtxStrJoin (char *dest, size_t bufsiz, const char *str1, const char *str2, const char *str3, const char *str4, const char *str5)

This function concatenates up to five substrings together into a single string.

Table 2.138. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
str1	Pointer to substring to join.
str2	Pointer to substring to join.
str3	Pointer to substring to join.
str4	Pointer to substring to join.
str5	Pointer to substring to join.

Returns: . Composite string consisting of all parts.

char* rtxStrDynJoin (OSCTXT *pctxt, const char *str1, const char *str2, const char *str3, const char *str4, const char *str5)

This function allocates memory for and concatenates up to five substrings together into a single string.

Table 2.139. Parameters

pctxt	Pointer to a standard context structure.
str1	Pointer to substring to join.
str2	Pointer to substring to join.

str3	Pointer to substring to join.
str4	Pointer to substring to join.
str5	Pointer to substring to join.

Returns: . Composite string consisting of all parts.

char* rtxStrTrimEnd (char *s)

This function trims whitespace from the end of a string.

Table 2.140. Parameters

s	Pointer to string to be trimmed.
---	----------------------------------

Returns: . Point to string s.

int rtxValidateConstrainedStr (OSCTXT *pctxt, const char *pvalue, const char *pCharSet)

This function will validate a constrained character string by checking to see if all the characters in the given string are contained within the

constraining character set.

Table 2.141. Parameters

pctxt	Pointer to a context block structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pvalue	A pointer to a null-terminated C character string to be validated.
pCharSet	A pointer to a null-terminated C character string containing the character set to validate against.

Returns: . Status of the validation attempt. A negative status value will be returned if validation is not successful.

int rtxIntToCharStr (OSINT32 value, char *dest, size_t bufsiz, char padchar)

This function converts a signed 32-bit integer into a character string. It is similar to the C `itoa` function.

Table 2.142. Parameters

value	Integer to convert.
dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
padchar	Left pad char, set to zero for no padding.

Returns: . Number of characters or negative status value if fail.

int rtxUIntToCharStr (OSUINT32 value, char *dest, size_t bufsiz, char padchar)

This function converts an unsigned 32-bit integer into a character string. It is similar to the C `itoa` function.

Table 2.143. Parameters

value	Integer to convert.
dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
padchar	Left pad char, set to zero for no padding.

Returns: . Number of characters or negative status value if fail.

int rtxInt64ToCharStr (OSINT64 value, char *dest, size_t bufsiz, char padchar)

This function converts a signed 64-bit integer into a character string. It is similar to the C `itoa` function.

Table 2.144. Parameters

value	Integer to convert.
dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
padchar	Left pad char, set to zero for no padding.

Returns: . Number of characters or negative status value if fail.

int rtxUInt64ToCharStr (OSUINT64 value, char *dest, size_t bufsiz, char padchar)

This function converts an unsigned 64-bit integer into a character string. It is similar to the C `itoa` function.

Table 2.145. Parameters

value	Integer to convert.
dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
padchar	Left pad char, set to zero for no padding.

Returns: . Number of characters or negative status value if fail.

int rtxSizeToCharStr (size_t value, char *dest, size_t bufsiz, char padchar)

This function converts a value of type 'size_t' into a character string. It is similar to the C `itoa` function.

Table 2.146. Parameters

value	Size value to convert.
dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
padchar	Left pad char, set to zero for no padding.

Returns: . Number of characters or negative status value if fail.

int rtxHexCharsToBinCount (const char *hexstr, size_t nchars)

This function returns a count of the number of bytes the would result from the conversion of a hexadecimal character string to binary. Any whitespace characters in the string are ignored.

Table 2.147. Parameters

hexstr	Hex character string to convert.
nchars	Number of characters in string. If zero, characters are read up to null-terminator.

Returns: . Number of bytes or negative status value if fail.

int rtxHexCharsToBin (const char *hexstr, size_t nchars, OSOCTET *binbuf, size_t bufsize)

This function converts the given hex string to binary. The result is stored in the given binary buffer. Any whitespace characters in the string are ignored.

Table 2.148. Parameters

hexstr	Hex character string to convert.
nchars	Number of characters in string. If zero, characters are read up to null-terminator.
binbuf	Buffer to hold converted binary data.
bufsize	Size of the binary data buffer.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToInt (const char *cstr, OSINT32 *pvalue)

This function converts the given character string to a signed 32-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.149. Parameters

cstr	Character string to convert.
pvalue	Pointer to integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrnTolnt (const char *cstr, OSSIZE ndigits, OSINT32 *pvalue)

This function converts up to the given number of digits from the given character string to a signed 32-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until either the number of digits is reached or a non-digit character is encountered.

Table 2.150. Parameters

cstr	Character string to convert.
ndigits	Number of digits to convert.
pvalue	Pointer to integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrTolnt8 (const char *cstr, OSINT8 *pvalue)

This function converts the given character string to a signed 8-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.151. Parameters

cstr	Character string to convert.
pvalue	Pointer to 8-bit integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrTolnt16 (const char *cstr, OSINT16 *pvalue)

This function converts the given character string to a signed 16-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.152. Parameters

cstr	Character string to convert.
pvalue	Pointer to 16-bit integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToInt64 (const char *cstr, OSINT64 *pvalue)

This function converts the given character string to a signed 64-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.153. Parameters

cstr	Character string to convert.
pvalue	Pointer to 64-bit integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToUInt (const char *cstr, OSUINT32 *pvalue)

This function converts the given character string to an unsigned 32-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.154. Parameters

cstr	Character string to convert.
pvalue	Pointer to 32-bit unsigned integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToUInt8 (const char *cstr, OSUINT8 *pvalue)

This function converts the given character string to an unsigned 8-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.155. Parameters

cstr	Character string to convert.
pvalue	Pointer to 8-bit unsigned integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToUInt16 (const char *cstr, OSUINT16 *pvalue)

This function converts the given character string to an unsigned 16-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.156. Parameters

cstr	Character string to convert.
------	------------------------------

pvalue	Pointer to 16-bit unsigned integer value to receive converted data.
--------	---

Returns: . Number of bytes or negative status value if fail.

int rtxCharStrToUInt64 (const char *cstr, OSUINT64 *pvalue)

This function converts the given character string to an unsigned 64-bit integer value. It consumes all leading whitespace before the digits start. It then consumes digits until a non-digit character is encountered.

Table 2.157. Parameters

cstr	Character string to convert.
pvalue	Pointer to 64-bit unsigned integer value to receive converted data.

Returns: . Number of bytes or negative status value if fail.

Date/time conversion functions

Detailed Description

These functions handle the conversion of date/time to and from various internal formats to XML schema standard string forms.

Functions

- int rtxDateToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxTimeToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxDateTimeToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGYearToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGYearMonthToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGMonthToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGMonthDayToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGDayToString (const OSNumDateTime * pvalue, OSUTF8CHAR * buffer, size_t bufsize)
- int rtxGetCurrDateTime (OSNumDateTime * pvalue)
- int rtxGetCurrDateTimeString (char * buffer, OSSIZE bufsize, OSBOOL local)
- int rtxCmpDate (const OSNumDateTime * pvalue1, const OSNumDateTime * pvalue2)
- int rtxCmpDate2 (const OSNumDateTime * pvalue, OSINT32 year, OSUINT8 mon, OSUINT8 day, OSBOOL tzflag, OSINT32 tzo)
- int rtxCmpTime (const OSNumDateTime * pvalue1, const OSNumDateTime * pvalue2)

- `int rtxCmpTime2 (const OSNumDateTime * pvalue, OSUINT8 hour, OSUINT8 min, OSREAL sec, OSBOOL tzflag, OSINT32 tzo)`
- `int rtxCmpDateTime (const OSNumDateTime * pvalue1, const OSNumDateTime * pvalue2)`
- `int rtxCmpDateTime2 (const OSNumDateTime * pvalue, OSINT32 year, OSUINT8 mon, OSUINT8 day, OSUINT8 hour, OSUINT8 min, OSREAL sec, OSBOOL tzflag, OSINT32 tzo)`
- `int rtxParseDateString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseTimeString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseDateTimeString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseGYearString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseGYearMonthString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseGMonthString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseGMonthDayString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxParseGDayString (const OSUTF8CHAR * inpdata, size_t inpdatalen, OSNumDateTime * pvalue)`
- `int rtxMSecsToDuration (OSINT32 msec, OSUTF8CHAR * buf, OSUINT32 bufsize)`
- `int rtxDurationToMSecs (OSUTF8CHAR * buf, OSUINT32 bufsize, OSINT32 * msec)`
- `int rtxSetDateTime (OSNumDateTime * pvalue, struct tm * timeStruct)`
- `int rtxGetGMTTime (struct tm * pvalue, time_t timeMs)`
- `int rtxGetLocalTime (struct tm * pvalue, time_t timeMs)`
- `int rtxSetLocalDateTime (OSNumDateTime * pvalue, time_t timeMs)`
- `int rtxSetUtcDateTime (OSNumDateTime * pvalue, time_t timeMs)`
- `int rtxGetDateTime (const OSNumDateTime * pvalue, time_t * timeMs)`
- `OSBOOL rtxDateIsValid (const OSNumDateTime * pvalue)`
- `OSBOOL rtxTimeIsValid (const OSNumDateTime * pvalue)`
- `OSBOOL rtxDateTimeIsValid (const OSNumDateTime * pvalue)`
- `int rtxAscTime (char * buffer, OSSIZE bufsize, struct tm * pvalue)`

Function Documentation

int rtxDateToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a numeric date value consisting of individual date components (year, month, day) into XML schema standard format (CCYY-MM-DD).

Table 2.158. Parameters

pvalue	Pointer to OSNumDateTime structure containing date components to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is at least nine bytes long to hold the formatted date and a null-terminator character.
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxTimeToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a numeric time value consisting of individual time components (hour, minute, second, fraction-of-second, time zone) into XML schema standard format (HH:MM:SS[.frac][TZ]).

Table 2.159. Parameters

pvalue	Pointer to OSNumDateTime structure containing time components to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string.
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxDateTimeToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a numeric date/time value of all components in the OSNumDateTime structure into XML schema standard format (CCYY-MM-DDTHH:MM:SS[.frac][TZ]).

Table 2.160. Parameters

pvalue	Pointer to OSNumDateTime structure containing date/time components to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string.
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxGYearToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a gregorian year value to a string (CCYY).

Table 2.161. Parameters

pvalue	Pointer to OSNumDateTime structure containing year value to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string (in this case, at least 5 characters long).
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxGYearMonthToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a gregorian year and month value to a string (CCYY-MM).

Table 2.162. Parameters

pvalue	Pointer to OSNumDateTime structure containing year and month value to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string (in this case, at least 8 characters long).
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxGMonthToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a gregorian month value to a string (MM).

Table 2.163. Parameters

pvalue	Pointer to OSNumDateTime structure containing month value to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string (in this case, at least 3 characters long).
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxGMonthDayToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a gregorian month and day value to a string (MM-DD).

Table 2.164. Parameters

pvalue	Pointer to OSNumDateTime structure containing month and day value to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string (in this case, at least 6 characters long).
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxGDayToString (const OSNumDateTime *pvalue, OSUTF8CHAR *buffer, size_t bufsize)

This function formats a gregorian day value to a string (DD).

Table 2.165. Parameters

pvalue	Pointer to OSNumDateTime structure containing day value to be formatted.
buffer	Buffer into which date is to be formatted. This is a fixed-sized buffer. The user must provide a buffer that is large enough to hold the formatted time string (in this case, at least 3 characters long).
bufsize	Size of the buffer to receive the formatted date.

Returns: . Completion status of operation:

- 0(RT_OK) = success,

- negative return value is error

int rtxGetCurrDateTime (OSNumDateTime *pvalue)

This function reads the system date and time and stores the value in the given OSNumDateTime structure variable.

Table 2.166. Parameters

pvalue	Pointer to OSNumDateTime structure.
--------	-------------------------------------

Returns: . Completion status of operation:

- 0 in case success
- negative in case failure

int rtxGetCurrDateTimeString (char *buffer, OSSIZE bufsize, OS-BOOL local)

This function reads the current system date and time and returns it as a formatted string. The format is that returned by the asctime system function.

Table 2.167. Parameters

buffer	Character buffer to receive string. Buffer should be at least 32 characters in size.
bufsize	Size of buffer. If string will not fit in buffer, an error is returned.
local	True for local time, false for GMT.

Returns: . Completion status of operation:

- 0 in case success
- negative in case failure

int rtxCmpDate (const OSNumDateTime *pvalue1, const OSNum-DateTime *pvalue2)

This function compares the date part of two OSNumDateTime structures and returns the result of the comparison.

Table 2.168. Parameters

pvalue1	Pointer to OSNumDateTime structure.
pvalue2	Pointer to OSNumDateTime structure.

Returns: . Completion status of operation:

- 0 Dates are same

- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxCmpDate2 (const OSNumDateTime *pvalue, OSINT32 year, OSUINT8 mon, OSUINT8 day, OSBOOL tzflag, OSINT32 tzo)

This function compares the date part of OSNumDateTime structure and date components, specified as parameters.

Table 2.169. Parameters

pvalue	Pointer to OSNumDateTime structure.
year	Year (-inf..inf)
mon	Month (1..12)
day	Day (1..31)
tzflag	TRUE, if time zone offset is set (see tzo parameter).
tzo	Time zone offset (-840..840).

Returns: . Completion status of operation:

- 0 Dates are same
- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxCmpTime (const OSNumDateTime *pvalue1, const OSNumDateTime *pvalue2)

This function compares the time part of two OSNumDateTime structures and returns the result of the comparison.

Table 2.170. Parameters

pvalue1	Pointer to OSNumDateTime structure.
pvalue2	Pointer to OSNumDateTime structure.

Returns: . Completion status of operation:

- 0 Times are same
- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxCmpTime2 (const OSNumDateTime *pvalue, OSUINT8 hour, OSUINT8 min, OSREAL sec, OSBOOL tzflag, OSINT32 tzo)

This function compares the time part of OSNumDateTime structure and time components, specified as parameters.

Table 2.171. Parameters

pvalue	Pointer to OSNumDateTime structure.
hour	Hour (0..23)
min	Minutes (0..59)
sec	Seconds (0.0..59.(9))
tzflag	TRUE, if time zone offset is set (see tzo parameter).
tzo	Time zone offset (-840..840).

Returns: . Completion status of operation:

- 0 Times are same
- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxCmpDateTime (const OSNumDateTime *pvalue1, const OSNumDateTime *pvalue2)

This function compares two OSNumDateTime structures and returns the result of the comparison.

Table 2.172. Parameters

pvalue1	Pointer to OSNumDateTime structure.
pvalue2	Pointer to OSNumDateTime structure.

Returns: . Completion status of operation:

- 0 Dates are same
- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxCmpDateTime2 (const OSNumDateTime *pvalue, OSINT32 year, OSUINT8 mon, OSUINT8 day, OSUINT8 hour, OSUINT8 min, OSREAL sec, OSBOOL tzflag, OSINT32 tzo)

This function compares the OSNumDateTime structure and dateTime components, specified as parameters.

Table 2.173. Parameters

pvalue	Pointer to OSNumDateTime structure.
year	Year (-inf..inf)

mon	Month (1..12)
day	Day (1..31)
hour	Hour (0..23)
min	Minutes (0..59)
sec	Seconds (0.0..59.(9))
tzflag	TRUE, if time zone offset is set (see tzo parameter).
tzo	Time zone offset (-840..840).

Returns: . Completion status of operation:

- 0 Dates are same
- +1 First Date/Time is greater than second.
- -1 First Date/Time is less than second.

int rtxParseDateString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a date value from a supplied string and sets the given OSNumDateTime argument to the decoded date value.

Table 2.174. Parameters

inpdata	Date string to be parsed/decoded as OSNumDateTime. <ul style="list-style-type: none"> • The format of date is CCYY-MM-DD • The value of CCYY is from 0000-9999 • The value of MM is 01 - 12 • The value of DD is 01 - XX (where XX is the Days in MM month in CCYY year)
inpdatalen	For decoding, consider inpdata string up to this length.
pvalue	The OSNumDateTime structure variable will be set to the decoded date value. <ul style="list-style-type: none"> • Only year, month,day value will be set. • The value of pvalue->year is in range 0 to 9999 • The value of pvalue->mon is in range 1 to 12 • The value of pvalue->day is in range 1 to XX

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseTimeString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a time value from a supplied string and sets the given OSNumDateTime structure to the decoded time value.

Table 2.175. Parameters

inpdata	<p>The inpdata is a time string to be parsed/decoded as OSNumDateTime.</p> <ul style="list-style-type: none"> • The format of date is hh:mm:ss.ss (1) or hh:mm:ss.ssZ (2) or hh:mm:ss.ss+HH:MM (3) or hh:mm:ss.ss-HH:MM (4) • The value of hh is from 00-23 • The value of mm is 00 - 59 • The value of ss.ss is 00.00 - 59.99 • The value of HH:MM is 00.00 - 24.00
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	<p>The OSNumDateTime structure variable will be set to the decoded time value.</p> <ul style="list-style-type: none"> • Only hour, min, sec value will be set. • The value of pvalue->hour is in range 0 to 23 • The value of pvalue->mon is in range 0 to 59 • The value of pvalue->day is in range 0 to 59.99 • The value of pvalue->tz_flag is FALSE for format(1) otherwise TRUE • The value of pvalue->tzo is 0 for format(2) otherwise Calculation of pvalue->tzo for format (3),(4) is HH*60+MM • The value of pvalue->tzo is -840 <= tzo <= 840 for format(3),(4) otherwise

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseDateTimeString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a datetime value from a supplied string and sets the given OSNumDateTime to the decoded date and time value.

Table 2.176. Parameters

inpdata	Input date/time string to be parsed.
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	The pointed OSNumDateTime structure variable will be set to the decoded date and time value.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseGYearString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a gregorian year value from a supplied string and sets the year in the given OSNumDateTime to the decoded value.

Table 2.177. Parameters

inpdata	Input string to be parsed.
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	The year field in the given OSNumDateTime structure variable will be set to the decoded value.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseGYearMonthString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a gregorian year and month value from a supplied string and sets the year and month fields in the given OSNumDateTime to the decoded values.

Table 2.178. Parameters

inpdata	Input string to be parsed.
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	The year and month fields in the given OSNumDateTime variable will be set to the decoded value.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseGMonthString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a gregorian month value from a supplied string and sets the month field in the given OSNumDateTime to the decoded value.

Table 2.179. Parameters

inpdata	Input string to be parsed.
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	The month field in the given OSNumDateTime variable will be set to the decoded value.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseGMonthDayString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a gregorian month and day value from a supplied string and sets the month and day fields in the given OSNumDateTime to the decoded values.

Table 2.180. Parameters

inpdata	Input string to be parsed.
inpdatalen	For decoding, consider the inpdata string up to this length.
pvalue	The month and day fields in the given OSNumDateTime variable will be set to the decoded values.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxParseGDayString (const OSUTF8CHAR *inpdata, size_t inpdatalen, OSNumDateTime *pvalue)

This function decodes a gregorian day value from a supplied string and sets the day field in the given OSNumDateTime to the decoded value.

Table 2.181. Parameters

inpdata	Input string to be parsed.
inpdataalen	For decoding, consider the inpdata string up to this length.
pvalue	The day field in the given OSNumDateTime variable will be set to the decoded value.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_BADVALUE). Return value is taken from rtxErrCodes.h header file

int rtxMsecsToDuration (OSINT32 msecs, OSUTF8CHAR *buf, OSUINT32 bufsize)

This function converts milliseconds to a duration string with format "PnYnMnDTnHnMnS". In case of negative duration a minus sign is prepended to the output string

Table 2.182. Parameters

msecs	Number of milliseconds.
buf	Output buffer to receive formatted duration.
bufsize	Output buffer size.

Returns: . Completion status of operation: 0 successful are same -1 unsuccessful

int rtxDurationToMsecs (OSUTF8CHAR *buf, OSUINT32 bufsize, OSINT32 *msecs)

This function converts a duration string to milliseconds. In the case of a string prepended with a minus sign (-) the duration in milliseconds will have negative value.

Table 2.183. Parameters

buf	Pointer to OSUTF8CHAR array.
bufsize	OSINT32 indicates the bufsize to be read.
msecs	OSINT32 updated after calculation.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error (RTERR_NOTINIT/RTERR_INVFORMAT/RTERR_TOOBIG). Return value is taken from rtxErrCodes.h header file

int rtxSetDateTime (OSNumDateTime *pvalue, struct tm *timeStruct)

This function converts a structure of type 'struct tm' to an OSNumDateTime structure.

Table 2.184. Parameters

pvalue	The pointed OSNumDateTime structure variable will be set to time value.
timeStruct	A pointer to tm structure to be converted.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

int rtxGetGMTime (struct tm *pvalue, time_t timeMs)

This function gets GM time. It provides a platform independent abstraction of the the C RTL gmtime function.

Table 2.185. Parameters

pvalue	A pointer to tm structure to receive time value.
timeMs	Time value to be converted to GMT.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

int rtxGetLocalTime (struct tm *pvalue, time_t timeMs)

This function gets local time. It provides a platform independent abstraction of the the C RTL localtime function.

Table 2.186. Parameters

pvalue	A pointer to tm structure to receive local time value.
timeMs	Time value to be converted to local time.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

int rtxSetLocalDateTime (OSNumDateTime *pvalue, time_t timeMs)

This function converts a local date and time value to an OSNumDateTime structure.

Table 2.187. Parameters

pvalue	The pointed OSNumDateTime structure variable will be set to time value.
timeMs	A calendar time encoded as a value of type time_t.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

int rtxSetUtcDateTime (OSNumDateTime *pvalue, time_t timeMs)

This function converts a UTC date and time value to an OSNumDateTime structure.

Table 2.188. Parameters

pvalue	The pointed OSNumDateTime structure variable will be set to time value.
timeMs	A calendar time encoded as a value of type time_t. The time is represented as seconds elapsed since midnight (00:00:00), January 1, 1970, coordinated universal time (UTC).

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

int rtxGetDateTime (const OSNumDateTime *pvalue, time_t *timeMs)

This function converts an OSNumDateTime structure to a calendar time encoded as a value of type time_t.

Table 2.189. Parameters

pvalue	The pointed OSNumDateTime structure variable to be converted.
timeMs	A pointer to time_t value to be set.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error.

OSBOOL rxDatelsValid (const OSNumDateTime *pvalue)

This function verifies that date members (year, month, day, timezone) of the OSNumDateTime structure contains valid values.

Table 2.190. Parameters

pvalue	Pointer to OSNumDateTime structure to be checked.
--------	---

Returns: . Boolean result: true means data is valid.

OSBOOL rtxTimelsValid (const OSNumDateTime *pvalue)

This function verifies that time members (hour, minute, second, timezone) of the OSNumDateTime structure contains valid values.

Table 2.191. Parameters

pvalue	Pointer to OSNumDateTime structure to be checked.
--------	---

Returns: . Boolean result: true means data is valid.

OSBOOL rtxDateTimelsValid (const OSNumDateTime *pvalue)

This function verifies that all members of the OSNumDateTime structure contains valid values.

Table 2.192. Parameters

pvalue	Pointer to OSNumDateTime structure to be checked.
--------	---

Returns: . Boolean result: true means data is valid.

int rtxAscTime (char *buffer, OSSIZE bufsize, struct tm *pvalue)

This function returns a string representation of the given date/time structure. It is similar to the std::asctime function except uses the secure version of asctime (asctime_s) for Windows.

Table 2.193. Parameters

buffer	Character array into which to write characetr data.
bufsize	Size of the character buffer.
pvalue	Pointer value to convert.

Returns: . Status of the conversion operation.

Floating-point number utility functions

Detailed Description

Floating-point utility function provide run-time functions for handling floating-point number types defined within a schema.

Functions

- OSREAL rtxGetMinusInfinity (OSVOIDARG)
- OSREAL rtxGetMinusZero (OSVOIDARG)
- OSREAL rtxGetNaN (OSVOIDARG)
- OSREAL rtxGetPlusInfinity (OSVOIDARG)
- OSBOOL rtxIsMinusInfinity (OSREAL value)
- OSBOOL rtxIsMinusZero (OSREAL value)
- OSBOOL rtxIsNaN (OSREAL value)
- OSBOOL rtxIsPlusInfinity (OSREAL value)
- OSBOOL rtxIsApproximate (OSREAL a, OSREAL b, OSREAL delta)
- OSBOOL rtxIsApproximateAbs (OSREAL a, OSREAL b, OSREAL delta)

Function Documentation

OSREAL rtxGetMinusInfinity (OSVOIDARG)

Returns the IEEE negative infinity value. This is defined as 0xffff000000000000 in IEEE standard 754. We assume the presence of the IEEE double type, that is, 64-bits of precision.

OSREAL rtxGetMinusZero (OSVOIDARG)

Returns the IEEE minus zero value. This is defined as 0x8000000000000000 in IEEE standard 754. We assume the presence of the IEEE double type, that is, 64-bits of precision.

OSREAL rtxGetNaN (OSVOIDARG)

Returns the IEEE Not-A-Number (NaN) value. This is defined as 0x7ff8000000000000 in IEEE standard 754. We assume the presence of the IEEE double type, that is, 64-bits of precision.

OSREAL rtxGetPlusInfinity (OSVOIDARG)

Returns the IEEE positive infinity value. This is defined as 0x7ff0000000000000 in IEEE standard 754. We assume the presence of the IEEE double type, that is, 64-bits of precision.

OSBOOL rtxIsMinusInfinity (OSREAL value)

A utility function that compares the given input value to the IEEE 754 value for negative infinity.

Table 2.194. Parameters

value	The input real value.
-------	-----------------------

OSBOOL rtxIsMinusZero (OSREAL value)

A utility function that compares the given input value to the IEEE 754 value for minus zero.

Table 2.195. Parameters

value	The input real value.
-------	-----------------------

OSBOOL rtxIsNaN (OSREAL value)

A utility function that compares the given input value to the IEEE 754 value for Not-A-Number (NaN).

Table 2.196. Parameters

value	The input real value.
-------	-----------------------

OSBOOL rtxIsPlusInfinity (OSREAL value)

A utility function that compares the given input value to the IEEE 754 value for positive infinity.

Table 2.197. Parameters

value	The input real value.
-------	-----------------------

OSBOOL rtxIsApproximate (OSREAL a, OSREAL b, OSREAL delta)

A utility function that return TRUE when first number are approximate to second number with given precision.

Table 2.198. Parameters

a	The input real value.
b	The input real value.
delta	difference must be low than delta * a 1E-7 - set best precision for float; 1E-15 - set best precision for double.

OSBOOL rtxIsApproximateAbs (OSREAL a, OSREAL b, OSREAL delta)

A utility function that return TRUE when first number are approximate to second number with given absolute precision.

Table 2.199. Parameters

a	The input real value.
---	-----------------------

b	The input real value.
delta	difference must be low than delta

Decimal number utility functions

Detailed Description

Decimal utility function provide run-time functions for handling decimal number types defined within a schema.

Functions

- `const char * rtxNR3toDecimal (OSCTXT * pctxt, const char * object_p)`

UTF-8 String Functions

Detailed Description

The UTF-8 string functions handle string operations on UTF-8 encoded strings. This is the default character string data type used for encoded XML data. UTF-8 strings are represented in C as strings of unsigned characters (bytes) to cover the full range of possible single character encodings.

Functions

- `long rtxUTF8ToUnicode (OSCTXT * pctxt, const OSUTF8CHAR * inbuf, OSUNICHAR * outbuf, size_t outbufsiz)`
- `long rtxUTF8ToUnicode32 (OSCTXT * pctxt, const OSUTF8CHAR * inbuf, OS32BITCHAR * outbuf, size_t outbufsiz)`
- `int rtxValidateUTF8 (OSCTXT * pctxt, const OSUTF8CHAR * inbuf)`
- `size_t rtxUTF8Len (const OSUTF8CHAR * inbuf)`
- `size_t rtxCalcUTF8Len (const OSUTF8CHAR * inbuf, size_t inbufBytes)`
- `size_t rtxUTF8LenBytes (const OSUTF8CHAR * inbuf)`
- `int rtxUTF8CharSize (OS32BITCHAR wc)`
- `int rtxUTF8EncodeChar (OS32BITCHAR wc, OSOCTET * buf, size_t bufsiz)`
- `int rtxUTF8DecodeChar (OSCTXT * pctxt, const OSUTF8CHAR * pinbuf, int * pInsize)`
- `OS32BITCHAR rtxUTF8CharToWC (const OSUTF8CHAR * buf, OSUINT32 * len)`
- `OSUTF8CHAR * rtxUTF8StrChr (OSUTF8CHAR * utf8str, OS32BITCHAR utf8char)`
- `OSUTF8CHAR * rtxUTF8Strdup (OSCTXT * pctxt, const OSUTF8CHAR * utf8str)`
- `OSUTF8CHAR * rtxUTF8Strndup (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, size_t nbytes)`
- `OSUTF8CHAR * rtxUTF8StrRefOrDup (OSCTXT * pctxt, const OSUTF8CHAR * utf8str)`

- OSBOOL rtxUTF8StrEqual (const OSUTF8CHAR * utf8str1, const OSUTF8CHAR * utf8str2)
- OSBOOL rtxUTF8StrnEqual (const OSUTF8CHAR * utf8str1, const OSUTF8CHAR * utf8str2, size_t count)
- int rtxUTF8Strempr (const OSUTF8CHAR * utf8str1, const OSUTF8CHAR * utf8str2)
- int rtxUTF8Strncmp (const OSUTF8CHAR * utf8str1, const OSUTF8CHAR * utf8str2, size_t count)
- OSUTF8CHAR * rtxUTF8Strncpy (OSUTF8CHAR * dest, size_t bufsiz, const OSUTF8CHAR * src)
- OSUTF8CHAR * rtxUTF8Strncpy (OSUTF8CHAR * dest, size_t bufsiz, const OSUTF8CHAR * src, size_t nchars)
- OSUINT32 rtxUTF8StrHash (const OSUTF8CHAR * str)
- const OSUTF8CHAR * rtxUTF8StrJoin (OSCTXT * pctxt, const OSUTF8CHAR * str1, const OSUTF8CHAR * str2, const OSUTF8CHAR * str3, const OSUTF8CHAR * str4, const OSUTF8CHAR * str5)
- int rtxUTF8StrToBool (const OSUTF8CHAR * utf8str, OSBOOL * pvalue)
- int rtxUTF8StrnToBool (const OSUTF8CHAR * utf8str, size_t nbytes, OSBOOL * pvalue)
- int rtxUTF8StrToDouble (const OSUTF8CHAR * utf8str, OSREAL * pvalue)
- int rtxUTF8StrnToDouble (const OSUTF8CHAR * utf8str, size_t nbytes, OSREAL * pvalue)
- int rtxUTF8StrToInt (const OSUTF8CHAR * utf8str, OSINT32 * pvalue)
- int rtxUTF8StrnToInt (const OSUTF8CHAR * utf8str, size_t nbytes, OSINT32 * pvalue)
- int rtxUTF8StrToUInt (const OSUTF8CHAR * utf8str, OSUINT32 * pvalue)
- int rtxUTF8StrnToUInt (const OSUTF8CHAR * utf8str, size_t nbytes, OSUINT32 * pvalue)
- int rtxUTF8StrToSize (const OSUTF8CHAR * utf8str, size_t * pvalue)
- int rtxUTF8StrnToSize (const OSUTF8CHAR * utf8str, size_t nbytes, size_t * pvalue)
- int rtxUTF8StrToInt64 (const OSUTF8CHAR * utf8str, OSINT64 * pvalue)
- int rtxUTF8StrnToInt64 (const OSUTF8CHAR * utf8str, size_t nbytes, OSINT64 * pvalue)
- int rtxUTF8StrToUInt64 (const OSUTF8CHAR * utf8str, OSUINT64 * pvalue)
- int rtxUTF8StrnToUInt64 (const OSUTF8CHAR * utf8str, size_t nbytes, OSUINT64 * pvalue)
- int rtxUTF8ToDynUniStr (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, const OSUNICHAR ** ppdata, OSUINT32 * pnchars)
- int rtxUTF8ToDynUniStr32 (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, const OS32BITCHAR ** ppdata, OSUINT32 * pnchars)
- int rtxUTF8RemoveWhiteSpace (const OSUTF8CHAR * utf8instr, size_t nbytes, const OSUTF8CHAR ** putf8outstr)
- int rtxUTF8StrToDynHexStr (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, OSDynOctStr * pvalue)
- int rtxUTF8StrnToDynHexStr (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, size_t nbytes, OSDynOctStr * pvalue)

- `int rtxUTF8StrToNamedBits (OSCTXT * pctxt, const OSUTF8CHAR * utf8str, const OSBitMapItem * pBitMap, OSOCTET * pvalue, OSUINT32 * pnbits, OSUINT32 bufsize)`
- `const OSUTF8CHAR * rtxUTF8StrNextTok (OSUTF8CHAR * utf8str, OSUTF8CHAR ** ppNext)`

Macros

- `#define rtxUTF8StrToInt32 rtxUTF8StrToInt`
- `#define rtxUTF8StrToUInt32 rtxUTF8StrToUInt`
- `#define RTUTF8STRCmpl rtxUTF8Strcmp(name,(const OSUTF8CHAR*)lstr)`
- `#define OSRTCHKUTF8LEN do { size_t nchars = rtxUTF8Len (str); \ stat = (nchars >= lower && nchars <= upper) ? 0 : RTERR_CONSVIO; } while(0)`

Function Documentation

long rtxUTF8ToUnicode (OSCTXT *pctxt, const OSUTF8CHAR *inbuf, OSUNICHAR *outbuf, size_t outbufsiz)

This function converts a UTF-8 string to a Unicode string (UTF-16). The Unicode string is stored as an array of 16-bit characters (unsigned short integers).

Table 2.200. Parameters

pctxt	A pointer to a context structure.
inbuf	UTF-8 string to convert.
outbuf	Output buffer to receive converted Unicode data.
outbufsiz	Size of the output buffer in bytes.

Returns: . Completion status of operation:

- number of Unicode characters in the string
- negative return value is error.

long rtxUTF8ToUnicode32 (OSCTXT *pctxt, const OSUTF8CHAR *inbuf, OS32BITCHAR *outbuf, size_t outbufsiz)

This function converts a UTF-8 string to a Unicode string (UTF-32). The Unicode string is stored as an array of 32-bit characters (unsigned integers).

Table 2.201. Parameters

pctxt	A pointer to a context structure.
inbuf	UTF-8 string to convert.
outbuf	Output buffer to receive converted Unicode data.

outbufsiz	Size of the output buffer in bytes.
-----------	-------------------------------------

Returns: . Completion status of operation:

- number of Unicode characters in the string
- negative return value is error.

int rtxValidateUTF8 (OSCTXT *pctx, const OSUTF8CHAR *inbuf)

This function will validate a UTF-8 encoded string to ensure that it is encoded correctly.

Table 2.202. Parameters

pctx	A pointer to a context structure.
inbuf	A pointer to the null-terminated UTF-8 encoded string.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

size_t rtxUTF8Len (const OSUTF8CHAR *inbuf)

This function will return the length (in characters) of a null-terminated UTF-8 encoded string.

Table 2.203. Parameters

inbuf	A pointer to the null-terminated UTF-8 encoded string.
-------	--

Returns: . Number of characters in string. Note that this may be different than the number of bytes as UTF-8 characters can span multiple-bytes.

size_t rtxUTF8LenBytes (const OSUTF8CHAR *inbuf)

This function will return the length (in bytes) of a null-terminated UTF-8 encoded string.

Table 2.204. Parameters

inbuf	A pointer to the null-terminated UTF-8 encoded string.
-------	--

Returns: . Number of bytes in the string.

int rtxUTF8CharSize (OS32BITCHAR wc)

This function will return the number of bytes needed to encode the given 32-bit universal character value as a UTF-8 character.

Table 2.205. Parameters

wc	32-bit wide character value.
----	------------------------------

Returns: . Number of bytes needed to encode as UTF-8.

int rtxUTF8EncodeChar (OS32BITCHAR wc, OSOCTET *buf, size_t bufsiz)

This function will convert a wide character into an encoded UTF-8 character byte string.

Table 2.206. Parameters

wc	32-bit wide character value.
buf	Buffer to receive encoded UTF-8 character value.
bufsiz	Size of the buffer ot receive the encoded value.

Returns: . Number of bytes consumed to encode character or negative status code if error.

int rtxUTF8DecodeChar (OSCTXT *pctxt, const OSUTF8CHAR *pinbuf, int *plnsize)

This function will convert an encoded UTF-8 character byte string into a wide character value.

Table 2.207. Parameters

pctxt	A pointer to a context structure.
pinbuf	Pointer to UTF-8 byte sequence to be decoded.
plnsize	Number of bytes that were consumed (i.e. size of the character).

Returns: . 32-bit wide character value.

OS32BITCHAR rtxUTF8CharToWC (const OSUTF8CHAR *buf, OSUINT32 *len)

This function will convert a UTF-8 encoded character value into a wide character.

Table 2.208. Parameters

buf	Pointer to UTF-8 character value.
len	Pointer to integer to receive decoded size (in bytes) of the UTF-8 character value sequence.

Returns: . Converted wide character value.

OSUTF8CHAR* rtxUTF8StrChr (OSUTF8CHAR *utf8str, OS32BITCHAR utf8char)

This function finds a character in the given UTF-8 character string. It is similar to the C `strchr` function.

Table 2.209. Parameters

utf8str	Null-terminated UTF-8 string to be searched.
utf8char	32-bit Unicode character to find.

Returns: . Pointer to the first occurrence of character in string, or NULL if character is not found.

OSUTF8CHAR* rtxUTF8Strdup (OSCTXT *pctxt, const OSUTF8CHAR *utf8str)

This function creates a duplicate copy of the given UTF-8 character string. It is similar to the C `strdup` function. Memory for the duplicated string is allocated using the `rtxMemAlloc` function.

Table 2.210. Parameters

pctxt	A pointer to a context structure.
utf8str	Null-terminated UTF-8 string to be duplicated.

Returns: . Pointer to duplicated string value.

OSUTF8CHAR* rtxUTF8Strndup (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, size_t nbytes)

This function creates a duplicate copy of the given UTF-8 character string. It is similar to the `rtxUTF8Strdup` function except that it allows the number of bytes to convert to be specified. Memory for the duplicated string is allocated using the `rtxMemAlloc` function.

Table 2.211. Parameters

pctxt	A pointer to a context structure.
utf8str	UTF-8 string to be duplicated.
nbytes	Number of bytes from <code>utf8str</code> to duplicate.

Returns: . Pointer to duplicated string value.

OSUTF8CHAR* rtxUTF8StrRefOrDup (OSCTXT *pctxt, const OSUTF8CHAR *utf8str)

This function check to see if the given UTF8 string pointer exists on the memory heap. If it does, its reference count is incremented; otherwise, a duplicate copy is made.

Table 2.212. Parameters

pctxt	A pointer to a context structure.
utf8str	Null-terminated UTF-8 string variable.

Returns: . Pointer to string value. This will either be the existing UTF-8 string pointer value (utf8str) or a new value.

OSBOOL rtxUTF8StrEqual (const OSUTF8CHAR *utf8str1, const OSUTF8CHAR *utf8str2)

This function compares two UTF-8 string values for equality.

Table 2.213. Parameters

utf8str1	UTF-8 string to be compared.
utf8str2	UTF-8 string to be compared.

Returns: . TRUE if equal, FALSE if not.

OSBOOL rtxUTF8StrnEqual (const OSUTF8CHAR *utf8str1, const OSUTF8CHAR *utf8str2, size_t count)

This function compares two UTF-8 string values for equality. It is similar to the `rtxUTF8StrEqual` function except that it allows the number of bytes to compare to be specified.

Table 2.214. Parameters

utf8str1	UTF-8 string to be compared.
utf8str2	UTF-8 string to be compared.
count	Number of bytes to compare.

Returns: . TRUE if equal, FALSE if not.

int rtxUTF8Strcmp (const OSUTF8CHAR *utf8str1, const OSUTF8CHAR *utf8str2)

This function compares two UTF-8 character strings and returns a trinary result (equal, less than, greater than). It is similar to the C `strcmp` function.

Table 2.215. Parameters

utf8str1	UTF-8 string to be compared.
----------	------------------------------

utf8str2	UTF-8 string to be compared.
----------	------------------------------

Returns: . -1 if utf8str1 is less than utf8str2, 0 if the two string are equal, and +1 if the utf8str1 is greater than utf8str2.

int rtxUTF8Strncmp (const OSUTF8CHAR *utf8str1, const OSUTF8CHAR *utf8str2, size_t count)

This function compares two UTF-8 character strings and returns a trinary result (equal, less than, greater than). In this case, a maximum count of the number of bytes to compare can be specified. It is similar to the C `strncmp` function.

Table 2.216. Parameters

utf8str1	UTF-8 string to be compared.
utf8str2	UTF-8 string to be compared.
count	Number of bytes to compare.

Returns: . -1 if utf8str1 is less than utf8str2, 0 if the two string are equal, and +1 if the utf8str1 is greater than utf8str2.

OSUTF8CHAR* rtxUTF8Strcpy (OSUTF8CHAR *dest, size_t bufsiz, const OSUTF8CHAR *src)

This function copies a null-terminated UTF-8 string to a target buffer. It is similar to the C `strcpy` function except more secure because it checks for buffer overrun.

Table 2.217. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
src	Pointer to null-terminated string to copy.

Returns: . Pointer to destination buffer or NULL if copy failed.

OSUTF8CHAR* rtxUTF8Strncpy (OSUTF8CHAR *dest, size_t bufsiz, const OSUTF8CHAR *src, size_t nchars)

This function copies the given number of characters from a UTF-8 string to a target buffer. It is similar to the C `strncpy` function except more secure because it checks for buffer overrun and ensures a null-terminator is copied to the end of the target buffer

Table 2.218. Parameters

dest	Pointer to destination buffer to receive string.
bufsiz	Size of the destination buffer.
src	Pointer to null-terminated string to copy.

nchars	Number of characters to copy.
--------	-------------------------------

Returns: . Pointer to destination buffer or NULL if copy failed.

OSUINT32 rtxUTF8StrHash (const OSUTF8CHAR *str)

This function computes a hash code for the given string value.

Table 2.219. Parameters

str	Pointer to string.
-----	--------------------

Returns: . Hash code value.

const OSUTF8CHAR* rtxUTF8StrJoin (OSCTXT *pctxt, const OSUTF8CHAR *str1, const OSUTF8CHAR *str2, const OSUTF8CHAR *str3, const OSUTF8CHAR *str4, const OSUTF8CHAR *str5)

This function concatenates up to five substrings together into a single string.

Table 2.220. Parameters

pctxt	Pointer to a context block structure.
str1	Pointer to substring to join.
str2	Pointer to substring to join.
str3	Pointer to substring to join.
str4	Pointer to substring to join.
str5	Pointer to substring to join.

Returns: . Composite string consisting of all parts. Memory is allocated for this string using rtxMemAlloc and must be freed using either rtxMemFreePtr or rtxMemFree. If memory allocation for the string fails, NULL is returned.

int rtxUTF8StrToBool (const OSUTF8CHAR *utf8str, OSBOOL *pvalue)

This function converts the given null-terminated UTF-8 string to a boolean (true/false) value. It is assumed the string contains only the tokens 'true', 'false', '1', or '0'.

Table 2.221. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to boolean value to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToBool (const OSUTF8CHAR *utf8str, size_t nbytes, OSBOOL *pvalue)

This function converts the given part of UTF-8 string to a boolean (true/false) value. It is assumed the string contains only the tokens 'true', 'false', '1', or '0'.

Table 2.222. Parameters

utf8str	Null-terminated UTF-8 string to convert
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to boolean value to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToDouble (const OSUTF8CHAR *utf8str, OSREAL *pvalue)

This function converts the given null-terminated UTF-8 string to a floating point (C/C++ double) value. It is assumed the string contains only numeric digits, special floating point characters (+,-,E,.), and whitespace. It is similar to the C atof function except that the result is returned as a separate argument and an error status value is returned if the conversion cannot be performed successfully.

Table 2.223. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to double to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToDouble (const OSUTF8CHAR *utf8str, size_t nbytes, OSREAL *pvalue)

This function converts the given part of UTF-8 string to a double value. It is assumed the string contains only numeric digits, whitespace, and other special floating point characters. It is similar to the C atof function except that the result is returned as a separate argument and an error status value is returned if the conversion cannot be performed successfully.

Table 2.224. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to double to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToInt (const OSUTF8CHAR *utf8str, OSINT32 *pvalue)

This function converts the given null-terminated UTF-8 string to an integer value. It is assumed the string contains only numeric digits and whitespace. It is similar to the C atoi function except that the result is returned as a separate argument and an error status value is returned if the conversion cannot be performed successfully.

Table 2.225. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToInt (const OSUTF8CHAR *utf8str, size_t nbytes, OSINT32 *pvalue)

This function converts the given part of UTF-8 string to an integer value. It is assumed the string contains only numeric digits and whitespace. It is similar to the C atoi function except that the result is returned as a separate argument and an error status value is returned if the conversion cannot be performed successfully.

Table 2.226. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8str.
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToUInt (const OSUTF8CHAR *utf8str, OSUINT32 *pvalue)

This function converts the given null-terminated UTF-8 string to an unsigned integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.227. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToUInt (const OSUTF8CHAR *utf8str, size_t nbytes, OSUINT32 *pvalue)

This function converts the given part of UTF-8 string to an unsigned integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.228. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToSize (const OSUTF8CHAR *utf8str, size_t *pvalue)

This function converts the given null-terminated UTF-8 string to a size value (type size_t). It is assumed the string contains only numeric digits and whitespace.

Table 2.229. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to size_t value to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToSize (const OSUTF8CHAR *utf8str, size_t nbytes, size_t *pvalue)

This function converts the given part of UTF-8 string to a size value (type size_t). It is assumed the string contains only numeric digits and whitespace.

Table 2.230. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to size_t value to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToInt64 (const OSUTF8CHAR *utf8str, OSINT64 *pvalue)

This function converts the given null-terminated UTF-8 string to a 64-bit integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.231. Parameters

utf8str	Null-terminated UTF-8 string to convert
---------	---

pvalue	Pointer to integer to receive result
--------	--------------------------------------

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToInt64 (const OSUTF8CHAR *utf8str, size_t nbytes, OSINT64 *pvalue)

This function converts the given part of UTF-8 string to a 64-bit integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.232. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrToUInt64 (const OSUTF8CHAR *utf8str, OSUINT64 *pvalue)

This function converts the given null-terminated UTF-8 string to an unsigned 64-bit integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.233. Parameters

utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8StrnToUInt64 (const OSUTF8CHAR *utf8str, size_t nbytes, OSUINT64 *pvalue)

This function converts the given part of UTF-8 string to an unsigned 64-bit integer value. It is assumed the string contains only numeric digits and whitespace.

Table 2.234. Parameters

utf8str	UTF-8 string to convert. Not necessary to be null-terminated.
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to integer to receive result

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8ToDynUniStr (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, const OSUNICHAR **ppdata, OSUINT32 *pnchars)

This function converts the given UTF-8 string to a Unicode string (UTF-16). Memory is allocated for the Unicode string using the rtxMemAlloc function. This memory will be freed when the context is freed (rtxFreeContext) or it can be freed using rtxMemFreePtr.

Table 2.235. Parameters

pctxt	A pointer to a context structure.
utf8str	UTF-8 string to convert, null-terminated.
ppdata	Pointer to pointer to receive output string.
pnchars	Pointer to integer to receive number of chars (the size of *ppdata array).

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8ToDynUniStr32 (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, const OS32BITCHAR **ppdata, OSUINT32 *pnchars)

This function converts the given UTF-8 string to a Unicode string (UTF-32). Memory is allocated for the Unicode string using the rtxMemAlloc function. This memory will be freed when the context is freed (rtxFreeContext) or it can be freed using rtxMemFreePtr.

Table 2.236. Parameters

pctxt	A pointer to a context structure.
utf8str	UTF-8 string to convert, null-terminated.
ppdata	Pointer to pointer to receive output string.
pnchars	Pointer to integer to receive number of chars (the size of *ppdata array).

Returns: . Status: 0 = OK, negative value = error

int rtxUTF8RemoveWhiteSpace (const OSUTF8CHAR *utf8instr, size_t nbytes, const OSUTF8CHAR **putf8outstr)

This function removes leading and trailing whitespace from a string.

Table 2.237. Parameters

utf8instr	Input UTF-8 string from which to removed whitespace.
nbytes	Size in bytes of utf8instr.
putf8outstr	Pointer to receive result string.

Returns: . Positive value = length of result string, negative value = error code.

int rtxUTF8StrToDynHexStr (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, OSDynOctStr *pvalue)

This function converts the given null-terminated UTF-8 string to a octet string value. The string consists of a series of hex digits. This is the dynamic version in which memory is allocated for the returned octet string variable.

Table 2.238. Parameters

pctxt	Pointer to context block structure.
utf8str	Null-terminated UTF-8 string to convert
pvalue	Pointer to a variable to receive the decoded octet string value.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxUTF8StrnToDynHexStr (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, size_t nbytes, OSDynOctStr *pvalue)

This function converts the given part of UTF-8 string to a octet string value. The string consists of a series of hex digits. This is the dynamic version in which memory is allocated for the returned octet string variable.

Table 2.239. Parameters

pctxt	Pointer to context block structure.
utf8str	Null-terminated UTF-8 string to convert
nbytes	Size in bytes of utf8Str.
pvalue	Pointer to a variable to receive the decoded octet string value.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxUTF8StrToNamedBits (OSCTXT *pctxt, const OSUTF8CHAR *utf8str, const OSBitMapItem *pBitMap, OSOCTET *pvalue, OSUINT32 *pnbits, OSUINT32 bufsize)

This function converts the given null-terminated UTF-8 string to named bit items. The token-to-bit mappings are defined by a bit map table that is passed into the function. It is assumed the string contains a space-separated list of named bit token values.

Table 2.240. Parameters

pctxt	Context structure
utf8str	Null-terminated UTF-8 string to convert
pBitMap	Bit map defining bit to otken mappings
pvalue	Pointer to byte array to receive result.
pnbits	Pointer to integer to received number of bits.
bufsize	Size of byte array to received decoded bits.

Returns: . Status: 0 = OK, negative value = error

const OSUTF8CHAR* rtxUTF8StrNextTok (OSUTF8CHAR *utf8str, OSUTF8CHAR **ppNext)

This function returns the next whitespace-separated token from the input string. It also returns a pointer to the first non-whitespace character after the parsed token. Note that the input string is altered in the operation as null-terminators are inserted to mark the token boundaries.

Table 2.241. Parameters

utf8str	Null-terminated UTF-8 string to parse. This string will be altered. Use rtxUTF8Strdup to make a copy of original string before calling this function if the original string cannot be altered.
ppNext	Pointer to receive next location in string after parsed token. This can be used as input to get the next token. If NULL returned, all tokens in the string have been parsed.

Returns: . Pointer to next parsed token. NULL if no more tokens.

Macro Definition Documentation

#define RTUTF8STRCmpl

Compare UTF-8 string to a string literal.

Table 2.242. Parameters

name	UTF-8 string variable.
lstr	C string literal value (quoted content such as "a")

Definition at line 567 of file rtxUTF8.h

The Documentation for this define was generated from the following file:

- rtxUTF8.h

Bit String Functions

Detailed Description

Bit string functions allow bits to be set, cleared, or tested in arbitrarily sized byte arrays.

Functions

- OSUINT32 rtxGetBitCount (OSUINT32 value)
- int rtxSetBit (OSOCTET * pBits, OSSIZE numbits, OSSIZE bitIndex)
- OSUINT32 rtxSetBitFlags (OSUINT32 flags, OSUINT32 mask, OSBOOL action)
- int rtxClearBit (OSOCTET * pBits, OSSIZE numbits, OSSIZE bitIndex)
- OSBOOL rtxTestBit (const OSOCTET * pBits, OSSIZE numbits, OSSIZE bitIndex)
- OSSIZE rtxLastBitSet (const OSOCTET * pBits, OSSIZE numbits)
- int rtxCheckBitBounds (OSCTXT * pctxt, OSOCTET ** ppBits, OSSIZE * pNumocts, OSSIZE minRequiredBits, OSSIZE preferredLimitBits)
- int rtxZeroUnusedBits (OSOCTET * pBits, OSSIZE numbits)
- int rtxCheckUnusedBitsZero (const OSOCTET * pBits, OSSIZE numbits)

Macros

- #define OSRTBYTEARRAYSIZE ((numbits+7)/8)

Function Documentation

OSUINT32 rtxGetBitCount (OSUINT32 value)

This function returns the minimum size of the bit field required to hold the given integer value.

Table 2.243. Parameters

value	Integer value
-------	---------------

Returns: . Minimum size of the the field in bits required to hold value.

int rtxSetBit (OSOCTET *pBits, OSSIZE numbits, OSSIZE bitIndex)

This function sets the specified zero-counted bit in the bit string.

Table 2.244. Parameters

pBits	Pointer to octets of bit string.
-------	----------------------------------

numbits	Number of bits in the bit string.
bitIndex	Index of bit to be set. The bit with index 0 is a most significant bit in the octet with index 0.

Returns: . If successful, returns the previous state of the bit. If bit was previously set, the return value is positive. If bit was not previously set, the return value is zero. Otherwise, return value is an error code:

- RTERR_OUTOFBND = bitIndex is out of bounds

OSUINT32 rtxSetBitFlags (OSUINT32 flags, OSUINT32 mask, OS-BOOL action)

This function sets one or more bits to TRUE or FALSE in a 32-bit unsigned bit flag set.

Table 2.245. Parameters

flags	Flags to which mask will be applied.
mask	Mask with one or more bits set that will be applied to pBitMask.
action	Boolean action indicating if bits in flags should be set (TRUE) or cleared (FALSE).

Returns: . Updated flags after mask is applied.

int rtxClearBit (OSOCKET *pBits, OSSIZE numbits, OSSIZE bitIndex)

This function clears the specified zero-counted bit in the bit string.

Table 2.246. Parameters

pBits	Pointer to octets of bit string.
numbits	Number of bits in the bit string.
bitIndex	Index of bit to be cleared. The bit with index 0 is a most significant bit in the octet with index 0.

Returns: . If successful, returns the previous state of the bit. If bit was previously set, the return value is positive. If bit was not previously set, the return value is zero. Otherwise, return value is an error code:

- RTERR_OUTOFBND = bitIndex is out of bounds

OSBOOL rtxTestBit (const OSOCKET *pBits, OSSIZE numbits, OSSIZE bitIndex)

This function tests the specified zero-counted bit in the bit string.

Table 2.247. Parameters

pBits	Pointer to octets of bit string.
-------	----------------------------------

numbits	Number of bits in the bit string.
bitIndex	Index of bit to be tested. The bit with index 0 is a most significant bit in the octet with index 0.

Returns: . True if bit set or false if not set or array index is beyond range of number of bits in the string.

OSSIZE rtxLastBitSet (const OSOCTET *pBits, OSSIZE numbits)

This function returns the zero-counted index of the last bit set in a bit string.

Table 2.248. Parameters

pBits	Pointer to the octets of the bit string.
numbits	The number of bits in the bit string.

Returns: . Index of the last bit set in the bit string. OSNULLINDEX if no bit is set.

int rtxCheckBitBounds (OSCTXT *pctxt, OSOCTET **ppBits, OSSIZE *pNumocts, OSSIZE minRequiredBits, OSSIZE preferredLimitBits)

Check whether the given bit string is large enough, and expand it if necessary.

Table 2.249. Parameters

pctxt	The context to use should memory need to be allocated.
ppBits	*ppBits is a pointer to the bit string, or NULL if one has not been created. If the string is expanded, *ppBits receives a pointer to the new bit string.
pNumocts	pNumocts points to the current size of the bit string in octets. If the bit string is expanded, *pNumocts receives the new size.
minRequiredBits	The minimum number of bits needed in the bit string. On return, pBits will point to a bit string with at least this many bits.
preferredLimitBits	The number of bits over which we prefer not to go. If nonzero, no more bytes will be allocated than necessary for this many bits, unless explicitly required by minRequiredBits.

Returns: . If successful, 0. Otherwise, an error code.

int rtxZeroUnusedBits (OSOCTET *pBits, OSSIZE numbits)

This function zeros unused bits at the end of the given bit string.

Table 2.250. Parameters

pBits	Pointer to the octets of the bit string.
numbits	The number of bits in the bit string.

Returns: . Zero if the operation is successful, or a negative status code if the operation fails.

int rtxCheckUnusedBitsZero (const OSOCTET *pBits, OSSIZE numbits)

This function checks to see if unused bits at the end of the given bit string are zero.

Table 2.251. Parameters

pBits	Pointer to the octets of the bit string.
numbits	The number of bits in the bit string.

Returns: . Zero if the operation is successful, or a negative status code if the operation fails. RTERR_INVBINS will be returned if bits at end are not zero.

Macro Definition Documentation

#define OSRTBYTEARRAYSIZE

This macro is used to calculate the byte array size required to hold the given number of bits.

Context Management Functions

Detailed Description

Context initialization functions handle the allocation, initialization, and destruction of context variables (variables of type OSCTXT). These variables hold all of the working data used during the process of encoding or decoding a message. The context provides thread safe operation by isolating what would otherwise be global variables within this structure. The context variable is passed from function to function as a message is encoded or decoded and maintains state information on the encoding or decoding process.

Classes

- struct OSRTErrLocn
- struct OSRTErrInfo
- struct OSRTErrInfoList
- struct OSRTBuffer
- struct OSRTBufSave
- struct OSBufferIndex

- struct OSCTXT

Typedefs

- typedef OSUINT32 OSRTFLAGS
- typedef int(* OSFreeCtxtAppInfoPtr
- typedef int(* OSResetCtxtAppInfoPtr
- typedef void(* OSFreeCtxtGlobalPtr
- typedef struct OSCTXT OSCTXT

Functions

- int rtxInitContext (OSCTXT * pctxt)

Typedef Documentation

typedef int(* OSFreeCtxtAppInfoPtr) (struct OSCTXT *pctxt)

OSRTFreeCtxtAppInfoPtr is a pointer to pctxt->pAppInfo free function, The pctxt->pAppInfo (pXMLInfo and pASN1Info) should contain the pointer to a structure and its first member should be a pointer to an appInfo free function.

typedef int(* OSResetCtxtAppInfoPtr) (struct OSCTXT *pctxt)

OSRTResetCtxtAppInfoPtr is a pointer to pctxt->pAppInfo reset function, The pctxt->pAppInfo (pXMLInfo and pASN1Info) should contain the pointer to a structure and its second member should be a pointer to appInfo reset function.

typedef void(* OSFreeCtxtGlobalPtr) (struct OSCTXT *pctxt)

OSRTFreeCtxtGlobalPtr is a pointer to a memory free function. This type describes the custom global memory free function generated by the compiler to free global nmemory. A pointer to a function of this type may be stored in the context gblFreeFunc field in order to free global data (pGlobalData) when rtxFreeContext is called.

Function Documentation

int rtxInitContext (OSCTXT *pctxt)

This function initializes an OSCTXT block. It sets all key working parameters to their correct initial state values. It is required that this function be invoked before using a context variable.

Table 2.252. Parameters

pctxt	Pointer to the context structure variable to be initialized.
-------	--

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxInitContextExt (OSCTXT *pctxt, OSMallocFunc malloc_func, OSReallocFunc realloc_func, OSFreeFunc free_func)

This function initializes an OSCTXT block. It sets all key working parameters to their correct initial state values. It is required that this function be invoked before using a context variable.

Table 2.253. Parameters

pctxt	Pointer to the context structure variable to be initialized.
malloc_func	Pointer to the memory allocation function.
realloc_func	Pointer to the memory reallocation function.
free_func	Pointer to the memory deallocation function.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxInitThreadContext (OSCTXT *pctxt, const OSCTXT *pSrcCtxt)

This function initializes a context for use in a thread. It is the same as rtxInitContext except that it copies the pointer to constant data from the given source context into the newly initialized thread context. It is assumed that the source context has been initialized and the custom generated global initialization function has been called. The main purpose of this function is to prevent multiple copies of global static data from being created within different threads.

Table 2.254. Parameters

pctxt	Pointer to the context structure variable to be initialized.
-------	--

pSrcCtxt	Pointer to source context which has been fully initialized including a pointer to global constant data initialized via a call to a generated 'Init_<project>_Global' function.
----------	--

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxInitContextUsingKey (OSCTXT *pctx, const OSOCTET *key, OSSIZE keylen)

This function initializes a context using a run-time key. This form is required for evaluation and limited distribution software. The compiler will generate a macro for rtxInitContext in the rtxkey.h file that will invoke this function with the generated run-time key.

Table 2.255. Parameters

pctx	The pointer to the context structure variable to be initialized.
key	Key data generated by ASN1C compiler.
keylen	Key data field length.

Returns: . Completion status of operation:

- 0 (ASN_OK) = success,
- negative return value is error.

int rtxInitContextBuffer (OSCTXT *pctx, OSOCTET *bufaddr, OSSIZE bufsiz)

This function assigns a message buffer to a context block. The block should have been previously initialized by rtxInitContext.

Table 2.256. Parameters

pctx	The pointer to the context structure variable to be initialized.
bufaddr	For encoding, the address of a memory buffer to receive the encoded message. If this address is NULL (0), encoding to a dynamic buffer will be done. For decoding, the address of a buffer that contains the message data to be decoded.
bufsiz	The size of the memory buffer. For encoding, this argument may be set to zero to indicate a dynamic memory buffer should be used.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxCtxtSetBufPtr (OSCTXT *pctxt, OSOCTET *bufaddr, OSSIZE bufsiz)

This function is used to set the internal buffer pointer for in-memory encoding or decoding. It must be called after the context variable is initialized before any other compiler generated or run-time library encode function.

Table 2.257. Parameters

pctxt	Pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
bufaddr	A pointer to a memory buffer to use to encode a message or that holds a message to be decoded. The buffer should be declared as an array of unsigned characters (OCTETs). This parameter can be set to NULL to specify dynamic encoding (i.e., the encode functions will dynamically allocate a buffer to hold the encoded message).
bufsiz	The length of the memory buffer in bytes. Should be set to zero if NULL was specified for bufaddr (i.e. dynamic encoding was selected).

OSSIZE rtxCtxtGetBitOffset (OSCTXT *pctxt)

This function returns the total bit offset to the current element in the context buffer.

Table 2.258. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . Bit offset.

int rtxCtxtSetBitOffset (OSCTXT *pctxt, OSSIZE offset)

This function sets the bit offset in the context to the given value.

Table 2.259. Parameters

pctxt	Pointer to a context structure.
offset	Bit offset.

Returns: . Completion status of operation:

- 0 = success,
- Negative status code if error

OSSIZE rtxCtxtGetIOByteCount (OSCTXT *pctxt)

This function returns the count of bytes either written to a stream or memory buffer.

Table 2.260. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . I/O byte count.

int rtxCheckContext (OSCTXT *pctxt)

This function verifies that the given context structure is initialized and ready for use.

Table 2.261. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . Completion status of operation:

- 0 = success,
- RTERR_NOTINIT status code if not initialized

void rtxFreeContext (OSCTXT *pctxt)

This function frees all dynamic memory associated with a context. This includes all memory allocated using the rtxMem functions using the given context parameter.

Table 2.262. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

void rtxCopyContext (OSCTXT *pdest, OSCTXT *psrc)

This function creates a copy of a context structure. The copy is a "shallow copy" (i.e. new copies of dynamic memory blocks held within the context are not made, only the pointers are transferred to the new context structure). This function is mainly for use from within compiler-generated code.

Table 2.263. Parameters

pdest	- Context structure to which data is to be copied.
psrc	- Context structure from which data is to be copied.

void rtxCtxtSetFlag (OSCTXT *pctxt, OSUINT32 mask)

This function is used to set a processing flag within the context structure.

Table 2.264. Parameters

pctxt	- A pointer to a context structure.
-------	-------------------------------------

mask	- Mask containing bit(s) to be set.
------	-------------------------------------

void rtxCtxtClearFlag (OSCTXT *pctxt, OSUINT32 mask)

This function is used to clear a processing flag within the context structure.

Table 2.265. Parameters

pctxt	- A pointer to a context structure.
mask	- Mask containing bit(s) to be cleared.

int rtxCtxtPushArrayElemName (OSCTXT *pctxt, const OSUTF8CHAR *elemName, OSSIZE idx)

This function is used to push an array element name onto the context element name stack. The name is formed by combining the given element name with the index to create a name of format name[index]. Dynamic memory is allocated for the resulting name using the rtxMemAlloc function.

Table 2.266. Parameters

pctxt	Pointer to a context structure.
elemName	Name of element to be pushed on stack.
idx	Index or the array element.

Returns: . Completion status of operation:

- 0 = success,
- RTERR_NOMEM if mem alloc for name fails.

int rtxCtxtPushElemName (OSCTXT *pctxt, const OSUTF8CHAR *elemName)

This function is used to push an element name onto the context element name stack.

Table 2.267. Parameters

pctxt	Pointer to a context structure.
elemName	Name of element to be pushed on stack. Note that a copy of the name is not made, the pointer to the name that is passed is stored.

Returns: . Completion status of operation:

- 0 = success,
- RTERR_NOMEM if mem alloc for list element fails.

int rtxCtxtPushElemNameCopy (OSCTXT *pctxt, const OSUTF8CHAR *elemName)

This function is used to push a copy of the given element name onto the context element name stack. A copy of the element name is made using context memory management. The name should be popped using the rtxCtxtPopElemNameCopy function to ensure memory is freed.

Table 2.268. Parameters

pctxt	Pointer to a context structure.
elemName	Name of element to be pushed on stack. A copy of the name is made.

Returns: . Completion status of operation:

- 0 = success,
- RTERR_NOMEM if mem alloc for name or list element fails.

int rtxCtxtPushTypeName (OSCTXT *pctxt, const OSUTF8CHAR *typeName)

This function is used to push a type name onto the context element name stack. The name is only added for the top-level type. This is determined by testing to ensure that there are no existing names on the stack.

Table 2.269. Parameters

pctxt	Pointer to a context structure.
typeName	Name of type to be pushed on stack. Note that a copy of the name is not made, the pointer to the name that is passed is stored.

Returns: . Completion status of operation:

- 0 = success,
- RTERR_NOMEM if mem alloc for name fails.

OSBOOL rtxCtxtPopArrayElemName (OSCTXT *pctxt)

This function pops the last element name from the context stack. This name is assumed to be an array element name pushed by the rtxCtxtPushArrayElemName function. The name is therefore dynamic and memory is freed for it using the rtxMemFreePtr function.

Table 2.270. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . True if name popped from stack or false if stack is empty.

const OSUTF8CHAR* rtxCtxtPopElemName (OSCTXT *pctxt)

This function pops the last element name from the context stack.

Table 2.271. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . Element name popped from stack or NULL if stack is empty.

void rtxCtxtPopElemNameCopy (OSCTXT *pctxt)

This function pops the last element name from the context stack and frees the associated memory. It is assumed it was added to the stack using the rtxCtxtPushElemNameCopy function.

Table 2.272. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

const OSUTF8CHAR* rtxCtxtPopTypeName (OSCTXT *pctxt)

This function pops the type name from the context stack. The name is only popped if the item count is one.

Table 2.273. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . Type name popped from stack or NULL if stack count not equal to one.

OSBOOL rtxCtxtContainerHasRemBits (OSCTXT *pctxt)

Return true iff there are bits remaining to be decoded in the current length-constrained container, which is possibly the outer PDU.

See also rtxCtxtPushContainer(Bits|Bytes)/rtxCtxtPopContainer

Table 2.274. Parameters

pctxt	Pointer to context structure.
-------	-------------------------------

OSBOOL rtxCtxtContainerEnd (OSCTXT *pctxt)

Return true if we are at the end of container - neither having more bits remaining nor having overrun it; otherwise return false. Overflowing the container should only be possible when a container length has been pushed onto the container stack, since the runtime doesn't allow going beyond the end of the buffer.

See also `rtxCtxtPushContainer(Bits|Bytes)/rtxCtxtPopContainer`

Table 2.275. Parameters

<code>pctxt</code>	Pointer to context structure.
--------------------	-------------------------------

OSSIZE `rtxCtxtGetContainerRemBits (OSCTXT *pctxt)`

Return the number of bits remaining to be decoded in the current length-constrained container, which is possibly the outer PDU.

See also `rtxCtxtPushContainer(Bits|Bytes)/rtxCtxtPopContainer`

Table 2.276. Parameters

<code>pctxt</code>	Pointer to context structure.
--------------------	-------------------------------

int `rtxCtxtPushContainerBytes (OSCTXT *pctxt, OSSIZE bytes)`

Notify the runtime layer of the start of decoding of a length-constrained container of a given length. This method should be called when the next bit to be decoded is the first bit of the length-constrained content.

This pushes an entry onto `pctxt->containerEndIndex`.

Table 2.277. Parameters

<code>pctxt</code>	Pointer to context structure.
<code>bytes</code>	Number of bytes of the length-constrained container.

Returns: . Completion status of operation:

- zero (0) = success,
- negative return value is error.

int `rtxCtxtPushContainerBits (OSCTXT *pctxt, OSSIZE bits)`

Notify the runtime layer of the start of decoding of a length-constrained container of a given length. This method should be called when the next bit to be decoded is the first bit of the length-constrained content.

This pushes an entry onto `pctxt->containerEndIndex`.

Table 2.278. Parameters

<code>pctxt</code>	Pointer to context structure.
<code>bits</code>	Number of bits in the length-constrained container.

Returns: . Completion status of operation:

- zero (0) = success,
- negative return value is error.

void rtxCtxtPopContainer (OSCTXT *pctxt)

Notify the runtime layer of the end of decoding of a length-constrained container of the given length. This method should be called when the final bit to be decoded has been decoded.

This pops an entry off of pctxt->containerEndIndex

Table 2.279. Parameters

pctxt	Pointer to context structure.
-------	-------------------------------

void rtxCtxtPopAllContainers (OSCTXT *pctxt)

Pop all containers from the container stack. This is useful for clearing the stack when an error has occurred. It is invoked automatically by rtxErrReset.

Table 2.280. Parameters

pctxt	Pointer to context structure.
-------	-------------------------------

void rtxMemHeapSetFlags (OSCTXT *pctxt, OSUINT32 flags)

This function sets flags to a heap. May be used to control the heap's behavior.

Table 2.281. Parameters

pctxt	Pointer to a memory block structure that contains the list of dynamic memory block maintained by these functions.
flags	The flags.

void rtxMemHeapClearFlags (OSCTXT *pctxt, OSUINT32 flags)

This function clears memory heap flags.

Table 2.282. Parameters

pctxt	Pointer to a memory block structure that contains the list of dynamic memory block maintained by these functions.
flags	The flags

int rtxMarkPos (OSCTXT *pctxt, OSSIZE *ppos)

This function saves the current position in a message buffer or stream.

Table 2.283. Parameters

pctxt	Pointer to a context block.
ppos	Pointer to saved position.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxResetToPos (OSCTXT *pctxt, OSSIZE pos)

This function resets a message buffer or stream back to the given position.

Table 2.284. Parameters

pctxt	Pointer to a context block.
pos	Context position.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

const char* rtxCtxtGetExpDateStr (OSCTXT *pctxt, char *buf, OSSIZE bufsiz)

This function will get the license expiration date for a time-limited license.

Table 2.285. Parameters

pctxt	Pointer to a context block.
buf	Buffer to receive date string.
bufsiz	Size of the buffer.

Returns: . Pointer to character string if successful (will be point to buf) or null if no expiration date was found.

void rtxLicenseClose (void)

Finish with current license and free internal resources. To avoid crashing your application:

- Do not call this during an exit handler function registered with atexit().

- Do not call this when another thread might concurrently trigger a license check by invoking methods in the `asn1c` runtime.

Macro Definition Documentation

#define OSNOWHITESPACE

Turn off unnecessary whitespace in text output. Currently, this affects Abstract Value Notation and JSON (JER) output.

Definition at line 149 of file `rtxContext.h`

The Documentation for this define was generated from the following file:

- `rtxContext.h`

#define rtxCtxtGetMsgPtr

This macro returns the start address of an encoded message. If a static buffer was used, this is simply the start address of the buffer. If dynamic encoding was done, this will return the start address of the dynamic buffer allocated by the encoder.

Note that this macro will not work with ASN.1 BER in-memory encoding. In this case, the BER-specific version of the function must be used.

Table 2.286. Parameters

<code>pctxt</code>	Pointer to a context structure.
--------------------	---------------------------------

Definition at line 451 of file `rtxContext.h`

The Documentation for this define was generated from the following file:

- `rtxContext.h`

#define rtxCtxtGetMsgLen

This macro returns the length of an encoded message. It will only work for in-memory encoding, not for encode to stream.

Note that this macro will not work with ASN.1 BER in-memory encoding. In this case, the BER-specific version of the function must be used.

Table 2.287. Parameters

<code>pctxt</code>	Pointer to a context structure.
--------------------	---------------------------------

Definition at line 462 of file `rtxContext.h`

The Documentation for this define was generated from the following file:

- `rtxContext.h`

#define rtxCtxtTestFlag

This macro tests if the given bit flag is set in the context.

Table 2.288. Parameters

pctxt	- A pointer to a context structure.
mask	- Bit flag to be tested

Definition at line 547 of file rtxContext.h

The Documentation for this define was generated from the following file:

- rtxContext.h

#define rtxCtxtPeekElemName

This macro returns the last element name from the context stack.

Table 2.289. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

Returns: . Element name from top of stack or NULL if stack is empty.

Definition at line 660 of file rtxContext.h

The Documentation for this define was generated from the following file:

- rtxContext.h

#define rtxByteAlign

This macro will byte-align the context buffer.

Definition at line 776 of file rtxContext.h

The Documentation for this define was generated from the following file:

- rtxContext.h

#define rtxCtxtSetProtocolVersion

This macro sets the protocol version in the context. This version number may be used in application code to do version specific operations. It is used in generated ASN.1 code with the extension addition version numbers to determine if an addition should be decoded.

For example, if this value is set to 8 and an extension addition group exists with version number 9 ([[9: ...]]), its contents will not be decoded.

Table 2.290. Parameters

pctxt	Pointer to a context structure.
value	The version number value.

Definition at line 829 of file rtxContext.h

The Documentation for this define was generated from the following file:

- rtxContext.h

Memory Allocation Macros and Functions

Detailed Description

Memory allocation functions and macros handle memory management for the C run-time. Special algorithms are used for allocation and deallocation of memory to improve the run-time performance.

Functions

- void rtxMemHeapAddRef (void ** ppvMemHeap)
- void * rtxMemHeapAlloc (void ** ppvMemHeap, OSSIZE nbytes)
- void * rtxMemHeapAllocZ (void ** ppvMemHeap, OSSIZE nbytes)
- void * rtxMemHeapSysAlloc (void ** ppvMemHeap, OSSIZE nbytes)
- void * rtxMemHeapSysAllocZ (void ** ppvMemHeap, OSSIZE nbytes)
- int rtxMemHeapCheckPtr (void ** ppvMemHeap, const void * mem_p)
- void rtxMemHeapFreeAll (void ** ppvMemHeap)
- void rtxMemHeapFreePtr (void ** ppvMemHeap, void * mem_p)
- void rtxMemHeapSysFreePtr (void ** ppvMemHeap, void * mem_p)
- void * rtxMemHeapRealloc (void ** ppvMemHeap, void * mem_p, OSSIZE nbytes_)
- void * rtxMemHeapSysRealloc (void ** ppvMemHeap, void * mem_p, OSSIZE nbytes_)
- void rtxMemHeapRelease (void ** ppvMemHeap)
- void rtxMemHeapReset (void ** ppvMemHeap)
- void rtxMemHeapSetProperty (void ** ppvMemHeap, OSUINT32 propId, void * pProp)
- void * rtxMemNewArray (OSSIZE nbytes)
- void * rtxMemNewArrayZ (OSSIZE nbytes)
- void rtxMemDeleteArray (void * mem_p)
- void * rtxMemHeapAutoPtrRef (void ** ppvMemHeap, void * ptr)

- `int rtxMemHeapAutoPtrUnref (void ** ppvMemHeap, void * ptr)`
- `int rtxMemHeapAutoPtrGetRefCount (void ** ppvMemHeap, void * mem_p)`
- `void rtxMemHeapInvalidPtrHook (void ** ppvMemHeap, const void * mem_p)`
- `void rtxMemHeapCheck (void ** ppvMemHeap, const char * file, int line)`
- `void rtxMemHeapPrint (void ** ppvMemHeap)`
- `void rtxMemHeapPrintWithFree (void ** ppvMemHeap)`
- `int rtxMemHeapCreate (void ** ppvMemHeap)`
- `int rtxMemHeapCreateExt (void ** ppvMemHeap, OSMallocFunc malloc_func, OSReallocFunc realloc_func, OSFreeFunc free_func)`
- `int rtxMemStaticHeapCreate (void ** ppvMemHeap, void * pmem, OSSIZE memsize)`
- `void rtxMemSetAllocFuncs (OSMallocFunc malloc_func, OSReallocFunc realloc_func, OSFreeFunc free_func)`
- `void rtxMemFreeOpenSeqExt (OSCTXT * pctxt, struct OSRTDList * pElemList)`
- `OSUINT32 rtxMemHeapGetDefBlkSize (OSCTXT * pctxt)`
- `void rtxMemSetDefBlkSize (OSUINT32 blkSize)`
- `OSUINT32 rtxMemGetDefBlkSize (OSVOIDARG)`
- `OSBOOL rtxMemHeapIsEmpty (OSCTXT * pctxt)`
- `OSBOOL rtxMemIsZero (const void * pmem, OSSIZE memsiz)`
- `void rtxMemFree (OSCTXT * pctxt)`
- `void rtxMemReset (OSCTXT * pctxt)`
- `void * rtxMemAllocArray2 (OSCTXT * pctxt, OSSIZE numElements, OSSIZE typeSize, OSUINT32 flags)`

Macros

- `#define ALLOC_ASN1ARRAY do { \ if (sizeof(type)*(pseqof)->n < (pseqof)->n) return RTERR_NOMEM; \ if (((pseqof)->elem = (type*) rtxMemHeapAllocZ \ (&(pctxt)->pMemHeap, sizeof(type)*(pseqof)->n)) == 0) return RTERR_NOMEM; \ } while (0)`
- `#define ALLOC_ASN1ARRAY1 do { \ if (sizeof(type)*(pseqof)->n < (pseqof)->n) (pseqof)->elem = 0; \ else (pseqof)->elem = (type*) rtxMemHeapAllocZ \ (&(pctxt)->pMemHeap, sizeof(type)*(pseqof)->n); \ } while (0)`
- `#define OSRTALLOCTYPE (type*) rtxMemHeapAlloc (&(pctxt)->pMemHeap, sizeof(type))`
- `#define OSRTALLOCTYPEZ (type*) rtxMemHeapAllocZ (&(pctxt)->pMemHeap, sizeof(type))`
- `#define OSRTREALLOCARRAY do { \ if (sizeof(type)*(pseqof)->n < (pseqof)->n) return RTERR_NOMEM; \ if (((pseqof)->elem = (type*) rtxMemHeapRealloc \ (&(pctxt)->pMemHeap, (pseqof)->elem, sizeof(type)*(pseqof)->n)) == 0) \ return RTERR_NOMEM; \ } while (0)`
- `#define OSCRTMALLOC0 malloc(nbytes)`

- #define OSCRTFREE0 free(ptr)
- #define OSCRTMALLOC rtxMemAlloc
- #define OSCRTFREE rtxMemFreePtr
- #define OSCDECL
- #define rtxMemAlloc rtxMemHeapAlloc(&(pctxt)->pMemHeap,nbytes)
- #define rtxMemSysAlloc rtxMemHeapSysAlloc(&(pctxt)->pMemHeap,nbytes)
- #define rtxMemAllocZ rtxMemHeapAllocZ(&(pctxt)->pMemHeap,nbytes)
- #define rtxMemSysAllocZ rtxMemHeapSysAllocZ(&(pctxt)->pMemHeap,nbytes)
- #define rtxMemRealloc rtxMemHeapRealloc(&(pctxt)->pMemHeap, (void*)mem_p, nbytes)
- #define rtxMemSysRealloc rtxMemHeapSysRealloc(&(pctxt)->pMemHeap,(void*)mem_p,nbytes)
- #define rtxMemFreePtr rtxMemHeapFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemSysFreePtr rtxMemHeapSysFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemAllocType (ctype*)rtxMemHeapAlloc(&(pctxt)->pMemHeap,sizeof(ctype))
- #define rtxMemSysAllocType (ctype*)rtxMemHeapSysAlloc(&(pctxt)->pMemHeap,sizeof(ctype))
- #define rtxMemAllocTypeZ (ctype*)rtxMemHeapAllocZ(&(pctxt)->pMemHeap,sizeof(ctype))
- #define rtxMemSysAllocTypeZ (ctype*)rtxMemHeapSysAllocZ(&(pctxt)->pMemHeap,sizeof(ctype))
- #define rtxMemFreeType rtxMemHeapFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemSysFreeType rtxMemHeapSysFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemAllocArray (type*)rtxMemAllocArray2 (pctxt, n, sizeof(type), 0)
- #define rtxMemSysAllocArray (type*)rtxMemAllocArray2 (pctxt, n, sizeof(type), RT_MH_SYSALLOC)
- #define rtxMemAllocArrayZ (type*)rtxMemAllocArray2 (pctxt, n, sizeof(type), RT_MH_ZEROARRAY)
- #define rtxMemFreeArray rtxMemHeapFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemSysFreeArray rtxMemHeapSysFreePtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemReallocArray (type*)rtxMemHeapRealloc(&(pctxt)->pMemHeap, (void*)mem_p, sizeof(type)*n)
- #define rtxMemNewAutoPtr rtxMemHeapAlloc(&(pctxt)->pMemHeap, nbytes)
- #define rtxMemAutoPtrRef rtxMemHeapAutoPtrRef(&(pctxt)->pMemHeap, (void*)(ptr))
- #define rtxMemAutoPtrUnref rtxMemHeapAutoPtrUnref(&(pctxt)->pMemHeap, (void*)(ptr))
- #define rtxMemAutoPtrGetRefCount rtxMemHeapAutoPtrGetRefCount(&(pctxt)->pMemHeap, (void*)(ptr))
- #define rtxMemCheckPtr rtxMemHeapCheckPtr(&(pctxt)->pMemHeap, (void*)mem_p)
- #define rtxMemCheck rtxMemHeapCheck(&(pctxt)->pMemHeap, __FILE__, __LINE__)

- #define rtxMemPrint rtxMemHeapPrint(&(pctx)->pMemHeap)
- #define rtxMemPrintWithFree rtxMemHeapPrintWithFree(&(pctx)->pMemHeap)
- #define rtxMemSetProperty rtxMemHeapSetProperty (&(pctx)->pMemHeap, propId, pProp)

Function Documentation

void rtxMemHeapPrint (void **ppvMemHeap)

Print details about the memory heap.

void rtxMemHeapPrintWithFree (void **ppvMemHeap)

Print the same details about the memory heap as rtxMemHeapPrint but add details about the free memory list.

int rtxMemHeapCreate (void **ppvMemHeap)

This function creates a standard memory heap. It is invoked internally from the rtxInitContext function to create the heap in the context.

Table 2.291. Parameters

ppvMemHeap	Pointer-to-pointer to variable to receive created object.
------------	---

Returns: . Status of the creation operation: 0 = success or RTERR-NOMEM if no memory available.

int rtxMemHeapCreateExt (void **ppvMemHeap, OSMallocFunc malloc_func, OSReallocFunc realloc_func, OSFreeFunc free_func)

This function creates a standard memory heap and sets the low-level memory functions to the specified values. It is invoked internally from the rtxInitContextExt function to create the heap in the context.

Table 2.292. Parameters

ppvMemHeap	Pointer-to-pointer to variable to receive created object.
malloc_func	Pointer to memory allocation function.
realloc_func	Pointer to memory reallocation function.
free_func	Pointer to memory free function.

Returns: . Status of the creation operation: 0 = success or RTERR-NOMEM if no memory available.

int rtxMemStaticHeapCreate (void **ppvMemHeap, void *pmem, OSSIZE memsize)

This function creates a static memory heap. All allocations are done from the static block of memory that is provided. It is much faster than the standard management but has some limitations such as the inability to free individual pointer values. All memory in the block must be freed at once.

Table 2.293. Parameters

ppvMemHeap	Pointer-to-pointer to variable to receive created object.
pmem	Pointer to static memory block to use for allocations.
memsize	Sizeof the memory block in bytes.

Returns: . Status of the creation operation: 0 = success or RTERR-NOMEM if no memory available.

void rtxMemSetAllocFuncs (OSMallocFunc malloc_func, OSReallocFunc realloc_func, OSFreeFunc free_func)

This function sets the pointers to standard allocation functions. These functions are used to allocate/reallocate/free memory blocks. By default, standard C functions - 'malloc', 'realloc' and 'free' - are used. But if some platforms do not support these functions (or some other reasons exist) they can be overloaded. The functions being overloaded should have the same prototypes as the standard functions.

Table 2.294. Parameters

malloc_func	Pointer to the memory allocation function ('malloc' by default).
realloc_func	Pointer to the memory reallocation function ('realloc' by default).
free_func	Pointer to the memory deallocation function ('free' by default).

OSUINT32 rtxMemHeapGetDefBlkSize (OSCTXT *pctxt)

This function returns the actual granularity of memory blocks in the context.

Table 2.295. Parameters

pctxt	Pointer to a context block.
-------	-----------------------------

void rtxMemSetDefBlkSize (OSUINT32 blkSize)

This function sets the minimum size and the granularity of memory blocks for newly created memory heaps.

Table 2.296. Parameters

blkSize	The minimum size and the granularity of memory blocks.
---------	--

OSUINT32 rtxMemGetDefBlkSize (OSVOIDARG)

This function returns the actual granularity of memory blocks.

Returns: . The currently used minimum size and the granularity of memory blocks.

OSBOOL rtxMemHeapsEmpty (OSCTXT *pctxt)

This function determines if the memory heap defined in the give context is empty (i.e. contains no outstanding memory allocations).

Table 2.297. Parameters

pctxt	Pointer to a context block.
-------	-----------------------------

Returns: . Boolean true value if heap is empty.

OSBOOL rtxMemIsZero (const void *pmem, OSSIZE memsiz)

This helper function determines if an arbitrarily sized block of memory is set to zero.

Table 2.298. Parameters

pmem	Pointer to memory block to check
memsiz	Size of the memory block

Returns: . Boolean result: true if memory is all zero

void rtxMemFree (OSCTXT *pctxt)

Free memory associated with a context. This macro frees all memory held within a context. This is all memory allocated using the rtxMemAlloc (and similar macros) and the rtxMem memory allocation functions using the given context variable.

Table 2.299. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

void rtxMemReset (OSCTXT *pctxt)

Reset memory associated with a context. This macro resets all memory held within a context. This is all memory allocated using the rtxMemAlloc (and similar macros) and the rtxMem memory allocation functions using the given context variable.

The difference between this and the OSMEMFREE macro is that the memory blocks held within the context are not actually freed. Internal pointers are reset so the existing blocks can be reused. This can provide a performance improvement for repetitive tasks such as decoding messages in a loop.

Table 2.300. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

Macro Definition Documentation

#define ALLOC_ASN1ARRAY

Allocate a dynamic array. This macro allocates a dynamic array of records of the given type. This version of the macro will return the RTERR_NOMEM error status if the memory request cannot be fulfilled.

Table 2.301. Parameters

pctxt	- Pointer to a context block
pseqof	- Pointer to a generated SEQUENCE OF array structure. The <i>n</i> member variable must be set to the number of records to allocate.
type	- Data type of an array record

Definition at line 1477 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define ALLOC_ASN1ARRAY1

Allocate a dynamic array. This macro allocates a dynamic array of records of the given type. This version of the macro will set the internal parameters of the SEQUENCE OF structure to NULL if the memory request cannot be fulfilled.

Table 2.302. Parameters

pctxt	- Pointer to a context block
pseqof	- Pointer to a generated SEQUENCE OF array structure. The <i>n</i> member variable must be set to the number of records to allocate.
type	- Data type of an array record

Definition at line 1495 of file asn1type.h

The Documentation for this define was generated from the following file:

- asn1type.h

#define OSRTALLOCTYPE

This macro allocates a single element of the given type.

Table 2.303. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

type	- Data type of record to allocate
------	-----------------------------------

Definition at line 77 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define OSRTALLOCTYPEZ

This macro allocates and zeros a single element of the given type.

Table 2.304. Parameters

pctxt	- Pointer to a context block
type	- Data type of record to allocate

Definition at line 86 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define OSRTREALLOCARRAY

Reallocate an array. This macro reallocates an array (either expands or contracts) to hold the given number of elements. The number of elements is specified in the *n* member variable of the pseqof argument.

Table 2.305. Parameters

pctxt	- Pointer to a context block
pseqof	- Pointer to a generated SEQUENCE OF array structure. The <i>n</i> member variable must be set to the number of records to allocate.
type	- Data type of an array record

Definition at line 100 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAlloc

Allocate memory. This macro allocates the given number of bytes. It is similar to the C `malloc` run-time function.

Table 2.306. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

nbytes	- Number of bytes of memory to allocate
--------	---

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 315 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysAlloc

This macro makes a direct call to the configured system memory allocation function. By default, this is the C malloc function, but it is possible to configure to use a custom allocation function.

Table 2.307. Parameters

pctxt	- Pointer to a context block
nbytes	- Number of bytes of memory to allocate

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 328 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAllocZ

Allocate and zero memory. This macro allocates the given number of bytes and then initializes the memory block to zero.

Table 2.308. Parameters

pctxt	- Pointer to a context block
nbytes	- Number of bytes of memory to allocate

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 340 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysAllocZ

Allocate and zero memory. This macro allocates the given number of bytes and then initializes the memory block to zero.

This macro makes a direct call to the configured system memory allocation function. By default, this is the C malloc function, but it is possible to configure to use a custom allocation function.

Table 2.309. Parameters

pctxt	- Pointer to a context block
nbytes	- Number of bytes of memory to allocate

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 356 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemRealloc

Reallocate memory. This macro reallocates a memory block (either expands or contracts) to the given number of bytes. It is similar to the C realloc run-time function.

Table 2.310. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to reallocate. This must have been allocated using the rtxMemAlloc macro or the rtxMemHeapAlloc function.
nbytes	- Number of bytes of memory to which the block is to be resized.

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request. This may be the same as the mem_p pointer that was passed in if the block did not need to be relocated.

Definition at line 374 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysRealloc

This macro makes a direct call to the configured system memory reallocation function to do the reallocation.. By default, this is the C realloc function, but it is possible to configure to use a custom reallocation function.

Table 2.311. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to reallocate. This must have been allocated using the rtxMemSysAlloc macro or the rtxMemHeapSysAlloc function.

nbytes	- Number of bytes of memory to which the block is to be resized.
--------	--

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request. This may be the same as the mem_p pointer that was passed in if the block did not need to be relocated.

Definition at line 393 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemFreePtr

Free memory pointer. This macro frees memory at the given pointer. The memory must have been allocated using the rtxMemAlloc (or similar) macros or the rtxMem memory allocation macros. This macro is similar to the C free function.

Table 2.312. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to free. This must have been allocated using the rtxMemAlloc macro or the rtxMemHeapAlloc function.

Definition at line 407 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysFreePtr

This macro makes a direct call to the configured system memory free function. By default, this is the C free function, but it is possible to configure to use a custom free function.

Table 2.313. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to free. This must have been allocated using the rtxMemSysAlloc macro or the rtxMemHeapSysAlloc function.

Definition at line 420 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAllocType

Allocate type. This macro allocates memory to hold a variable of the given type.

Table 2.314. Parameters

pctxt	- Pointer to a context block
ctype	- Name of C typedef

Returns: . - Pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 458 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysAllocType

Allocate type. This macro allocates memory to hold a variable of the given type.

This macro makes a direct call to the configured system memory allocation function. By default, this is the C malloc function, but it is possible to configure to use a custom allocation function.

Table 2.315. Parameters

pctxt	- Pointer to a context block
ctype	- Name of C typedef

Returns: . - Pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 474 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAllocTypeZ

Allocate type and zero memory. This macro allocates memory to hold a variable of the given type and initializes the allocated memory to zero.

Table 2.316. Parameters

pctxt	- Pointer to a context block
ctype	- Name of C typedef

Returns: . - Pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 486 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysAllocTypeZ

Allocate type and zero memory. This macro allocates memory to hold a variable of the given type and initializes the allocated memory to zero.

This macro makes a direct call to the configured system memory allocation function. By default, this is the C `malloc` function, but it is possible to configure to use a custom allocation function.

Table 2.317. Parameters

pctxt	- Pointer to a context block
ctype	- Name of C typedef

Returns: . - Pointer to allocated memory or NULL if insufficient memory was available to fulfill the request.

Definition at line 502 of file `rtxMemory.h`

The Documentation for this define was generated from the following file:

- `rtxMemory.h`

#define rtxMemFreeType

Free memory pointer. This macro frees memory at the given pointer. The memory must have been allocated using the `rtxMemAlloc` (or similar) macros or the `rtxMem` memory allocation macros. This macro is similar to the C `free` function.

Table 2.318. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to free. This must have been allocated using the <code>rtxMemAlloc</code> or <code>rtxMemAlloc</code> macro or the <code>rtxMemHeapAlloc</code> function.

Definition at line 516 of file `rtxMemory.h`

The Documentation for this define was generated from the following file:

- `rtxMemory.h`

#define rtxMemSysFreeType

Free memory pointer. This macro frees memory at the given pointer. The memory must have been allocated using the `rtxMemSysAlloc` (or similar) macros or the `rtxMemSys` memory allocation macros. This macro is similar to the C `free` function.

Table 2.319. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

mem_p	- Pointer to memory block to free. This must have been allocated using the rtxMemSysAlloc or rtxMemSysAlloc macro or the rtxMemSysHeapAlloc function.
-------	---

Definition at line 530 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAllocArray

Allocate a dynamic array. This macro allocates a dynamic array of records of the given type. The pointer to the allocated array is returned to the caller.

Table 2.320. Parameters

pctxt	- Pointer to a context block
n	- Number of records to allocate
type	- Data type of an array record

Definition at line 542 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysAllocArray

Allocate a dynamic array. This macro allocates a dynamic array of records of the given type. The pointer to the allocated array is returned to the caller.

This macro makes a direct call to the configured system memory allocation function. By default, this is the C malloc function, but it is possible to configure to use a custom allocation function.

Table 2.321. Parameters

pctxt	- Pointer to a context block
n	- Number of records to allocate
type	- Data type of an array record

Definition at line 561 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAllocArrayZ

Allocate a dynamic array and zero memory. This macro allocates a dynamic array of records of the given type and writes zeros over the allocated memory. The pointer to the allocated array is returned to the caller.

Table 2.322. Parameters

pctxt	- Pointer to a context block
n	- Number of records to allocate
type	- Data type of an array record

Definition at line 573 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemFreeArray

Free memory pointer. This macro frees memory at the given pointer. The memory must have been allocated using the rtxMemAlloc (or similar) macros or the rtxMem memory allocation macros. This macro is similar to the C `free` function.

Table 2.323. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to free. This must have been allocated using the rtxMemAlloc or rtxMemAlloc macro or the rtxMemHeapAlloc function.

Definition at line 587 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSysFreeArray

Free memory pointer. This macro frees memory at the given pointer. The memory must have been allocated using the rtxMemSysAlloc (or similar) macros or the rtxMemSys memory allocation macros. This macro is similar to the C `free` function.

Table 2.324. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to free. This must have been allocated using the rtxMemSysAlloc or rtxMemSysAlloc macro or the rtxMemSysHeapAlloc function.

Definition at line 601 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemReallocArray

Reallocate memory. This macro reallocates a memory block (either expands or contracts) to the given number of bytes. It is similar to the C `realloc` run-time function.

Table 2.325. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block to reallocate. This must have been allocated using the <code>rtxMemAlloc</code> macro or the <code>rtxMemHeapAlloc</code> function.
n	- Number of items of the given type to be allocated.
type	- Array element data type (for example, <code>int</code>).

Returns: . - Void pointer to allocated memory or NULL if insufficient memory was available to fulfill the request. This may be the same as the `pmem` pointer that was passed in if the block did not need to be relocated.

Definition at line 618 of file `rtxMemory.h`

The Documentation for this define was generated from the following file:

- `rtxMemory.h`

#define rtxMemNewAutoPtr

This function allocates a new block of memory and creates an auto-pointer with reference count set to one. The `rtxMemAutoPtrRef` and `rtxMemAutoPtrUnref` functions can be used to increment and decrement the reference count. When the count goes to zero, the memory held by the pointer is freed.

Table 2.326. Parameters

pctxt	Pointer to a context structure.
nbytes	Number of bytes to allocate.

Returns: . - Pointer to allocated memory or NULL if not enough memory is available.

Definition at line 634 of file `rtxMemory.h`

The Documentation for this define was generated from the following file:

- `rtxMemory.h`

#define rtxMemAutoPtrRef

This function increments the auto-pointer reference count.

Table 2.327. Parameters

pctxt	Pointer to a context structure.
-------	---------------------------------

ptr	Pointer on which reference count is to be incremented.
-----	--

Returns: . Referenced pointer value (ptr argument) or NULL if reference count could not be incremented.

Definition at line 645 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAutoPtrUnref

This function decrements the auto-pointer reference count. If the count goes to zero, the memory is freed.

Table 2.328. Parameters

pctxt	Pointer to a context structure.
ptr	Pointer on which reference count is to be decremented.

Returns: . Positive reference count or a negative error code. If zero, memory held by pointer will have been freed.

Definition at line 658 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemAutoPtrGetRefCount

This function returns the reference count of the given pointer. goes to zero, the memory is freed.

Table 2.329. Parameters

pctxt	Pointer to a context structure.
ptr	Pointer on which reference count is to be fetched.

Returns: . Pointer reference count.

Definition at line 669 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemCheckPtr

Check memory pointer. This macro check pointer on presence in heap.

Table 2.330. Parameters

pctxt	- Pointer to a context block
mem_p	- Pointer to memory block.

Returns: . 1 - pointer refer to memory block in heap; 0 - pointer refer not memory heap block.

Definition at line 680 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemCheck

Check memory heap.

Table 2.331. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

Definition at line 688 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemPrint

Print memory heap structure to stderr.

Table 2.332. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

Definition at line 696 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemPrintWithFree

Print memory heap structure to stderr, the same as rtxMemPrint, but add details about the memory free list.

Table 2.333. Parameters

pctxt	- Pointer to a context block
-------	------------------------------

Definition at line 705 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

#define rtxMemSetProperty

Set memory heap property.

Table 2.334. Parameters

pctxt	- Pointer to a context block
propId	- Property Id.
pProp	- Pointer to property value.

Definition at line 715 of file rtxMemory.h

The Documentation for this define was generated from the following file:

- rtxMemory.h

Memory Buffer Management Functions

Detailed Description

Memory buffer management functions handle the allocation, expansion, and deallocation of dynamic memory buffers used by some encode/decode functions. Dynamic memory buffers are buffers that can grow or shrink to hold variable sized amounts of data. This group of functions allows data to be appended to buffers, to be set within buffers, and to be retrieved from buffers. Currently, these functions are used within the generated SAX decode routines to collect data as it is parsed by an XML parser.

Classes

- struct OSRTMEMBUF

Typedefs

- typedef struct OSRTMEMBUF OSRTMEMBUF

Functions

- int rtxMemBufAppend (OSRTMEMBUF * pMemBuf, const OSOCTET * pdata, OSSIZE nbytes)
- int rtxMemBufCut (OSRTMEMBUF * pMemBuf, OSSIZE fromOffset, OSSIZE nbytes)
- void rtxMemBufFree (OSRTMEMBUF * pMemBuf)
- OSOCTET * rtxMemBufGetData (const OSRTMEMBUF * pMemBuf, int * length)

- OSOCTET * rtxMemBufGetDataExt (const OSRTMEMBUF * pMemBuf, OSSIZE * length)
- OSSIZE rtxMemBufGetDataLen (const OSRTMEMBUF * pMemBuf)
- void rtxMemBufInit (OSCTXT * pCtxt, OSRTMEMBUF * pMemBuf, OSSIZE segsize)
- void rtxMemBufInitBuffer (OSCTXT * pCtxt, OSRTMEMBUF * pMemBuf, OSOCTET * buf, OSSIZE bufsize, OSSIZE segsize)
- int rtxMemBufPreAllocate (OSRTMEMBUF * pMemBuf, OSSIZE nbytes)
- void rtxMemBufReset (OSRTMEMBUF * pMemBuf)
- int rtxMemBufSet (OSRTMEMBUF * pMemBuf, OSOCTET value, OSSIZE nbytes)
- OSBOOL rtxMemBufSetExpandable (OSRTMEMBUF * pMemBuf, OSBOOL isExpandable)
- OSBOOL rtxMemBufSetUseSysMem (OSRTMEMBUF * pMemBuf, OSBOOL value)
- OSSIZE rtxMemBufTrimW (OSRTMEMBUF * pMemBuf)

Macros

- #define OSMBDFLTSEGSIZE 1024
- #define OSMEMBUFPTR ((pmb)->buffer + (pmb)->startidx)
- #define OSMEMBUFENDPTR ((pmb)->buffer + (pmb)->startidx + (pmb)->usedcnt)
- #define OSMEMBUFUSEDSize ((OSSIZE)(pmb)->usedcnt)
- #define OSMBAPPENDSTR if (0 != str) \ rtxMemBufAppend(pmb,(OSOCTET*)str,OSCRTLSTRLEN(str))
- #define OSMBAPPENDSTRL rtxMemBufAppend(pmb,(OSOCTET*)str,OSCRTLSTRLEN(str))
- #define OSMBAPPENDUTF8 if (0 != str) \ rtxMemBufAppend(pmb,(OSOCTET*)str,rtxUTF8LenBytes(str))

Function Documentation

int rtxMemBufAppend (OSRTMEMBUF *pMemBuf, const OSOCTET *pdata, OSSIZE nbytes)

This function appends the data to the end of a memory buffer. If the buffer was dynamic and full then the buffer will be reallocated. If it is static (the static buffer was assigned by a call to rtxMemBufInitBuffer) or it is empty (no memory previously allocated) then a new buffer will be allocated.

Table 2.335. Parameters

pMemBuf	A pointer to a memory buffer structure.
pdata	The pointer to the buffer to be appended. The data will be copied at the end of the memory buffer.

nbytes	The number of bytes to be copied from pData.
--------	--

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

int rtxMemBufCut (OSRTMEMBUF *pMemBuf, OSSIZE fromOffset, OSSIZE nbytes)

This function cuts off the part of memory buffer. The beginning of the cutting area is specified by offset "fromOffset" and the length is specified by "nbytes". All data in this part will be lost. The data from the offset "fromOffset + nbytes" will be moved to "fromOffset" offset.

Table 2.336. Parameters

pMemBuf	A pointer to a memory buffer structure.
fromOffset	The offset of the beginning part, being cut off.
nbytes	The number of bytes to be cut off from the memory buffer.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

void rtxMemBufFree (OSRTMEMBUF *pMemBuf)

This function frees the memory buffer. If memory was allocated then it will be freed. Do not use the memory buffer structure after this function is called.

Table 2.337. Parameters

pMemBuf	A pointer to a memory buffer structure.
---------	---

OSOCKET* rtxMemBufGetData (const OSRTMEMBUF *pMemBuf, int *length)

This function returns the pointer to the used part of a memory buffer.

Table 2.338. Parameters

pMemBuf	A pointer to a memory buffer structure.
length	The pointer to the length of the used part of the memory buffer.

Returns: . The pointer to the used part of the memory buffer.

OSOCKET* rtxMemBufGetDataExt (const OSRTMEMBUF *pMemBuf, OSSIZE *length)

This function returns the pointer to the used part of a memory buffer. The extended version returns length in a size-typed argument which is a 64-bit value on many systems.

Table 2.339. Parameters

pMemBuf	A pointer to a memory buffer structure.
length	The pointer to the length of the used part of the memory buffer.

Returns: . The pointer to the used part of the memory buffer.

OSSIZE rtxMemBufGetDataLen (const OSRTMEMBUF *pMemBuf)

This function returns the length of the used part of a memory buffer.

Table 2.340. Parameters

pMemBuf	A pointer to a memory buffer structure.
---------	---

Returns: . The length of the used part of the buffer.

void rtxMemBufInit (OSCTXT *pCtxt, OSRTMEMBUF *pMemBuf, OSSIZE segsize)

This function initializes a memory buffer structure. It does not allocate memory; it sets the fields of the structure to the proper states. This function must be called before any operations with the memory buffer.

Table 2.341. Parameters

pCtxt	A provides a storage area for the function to store all working variables that must be maintained between function calls.
pMemBuf	A pointer to the initialized memory buffer structure.
segsize	The number of bytes in which the memory buffer will be expanded incase it is full.

void rtxMemBufInitBuffer (OSCTXT *pCtxt, OSRTMEMBUF *pMemBuf, OSOCKET *buf, OSSIZE bufsize, OSSIZE segsize)

This function assigns a static buffer to the memory buffer structure. It does not allocate memory; it sets the pointer to the passed buffer. If additional memory is required (for example, additional data is appended to the buffer using rtxMemBufAppend) and a non-zero segsize was specified, a dynamic buffer will be allocated and all data copied to the new buffer.

Table 2.342. Parameters

pCtxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pMemBuf	A pointer to a memory buffer structure.
buf	A pointer to the buffer to be assigned.
bufsize	The size of the buffer.
segsize	The number of bytes on which the memory buffer will be expanded in case it is full. If 0, when expansion is needed, an RTERR_NOMEM error will result.

int rtxMemBufPreAllocate (OSRTMEMBUF *pMemBuf, OSSIZE nbytes)

This function allocates a buffer with a predetermined amount of space.

Table 2.343. Parameters

pMemBuf	A pointer to a memory buffer structure.
nbytes	The number of bytes to be copied from pData.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

void rtxMemBufReset (OSRTMEMBUF *pMemBuf)

This function resets the memory buffer structure. It does not free memory, just sets the pointer to the beginning and the used length to zero.

Table 2.344. Parameters

pMemBuf	A pointer to a memory buffer structure.
---------	---

int rtxMemBufSet (OSRTMEMBUF *pMemBuf, OSOCTET value, OSSIZE nbytes)

This function sets part of a memory buffer to a specified octet value. The filling is started from the end of the memory buffer. If the buffer is dynamic and full, then the buffer will be reallocated. If it is static (a static buffer was assigned by a call to rtxMemBufInitBuffer) or it is empty (no memory previously was allocated) then a new buffer will be allocated.

Table 2.345. Parameters

pMemBuf	A pointer to a memory buffer structure.
---------	---

value	The pointer to the buffer to be appended. The data will be copied at the end of the memory buffer.
nbytes	The number of bytes to be copied from pData.

Returns: . Completion status of operation:

- 0 = success,
- negative return value is error.

OSBOOL rtxMemBufSetExpandable (OSRTMEMBUF *pMemBuf, OS- BOOL isExpandable)

This function sets "isExpandable" flag for the memory buffer object. By default, this flag is set to TRUE, thus, memory buffer could be expanded, even if it was initialized by static buffer (see `rtxMemBufInitBuffer`). If flag is cleared and buffer is full the `rtxMemBufAppend`/`rtxMemBufPreAllocate` functions will return error status.

Table 2.346. Parameters

pMemBuf	A pointer to a memory buffer structure.
isExpandable	TRUE, if buffer should be expandable.

Returns: . Previous state of "isExpandable" flag.

OSBOOL rtxMemBufSetUseSysMem (OSRTMEMBUF *pMemBuf, OS- BOOL value)

This function sets a flag to indicate that system memory management should be used instead of the custom memory manager. This should be used if the allocated buffer must be preserved after calls to `rtxMemFree` or `rtxMemReset`.

Table 2.347. Parameters

pMemBuf	A pointer to a memory buffer structure.
value	Boolean indicating system memory management to be used.

Returns: . Previous state of "useSysMem" flag.

OSSIZE rtxMemBufTrimW (OSRTMEMBUF *pMemBuf)

This function trims white space of the memory buffer.

Table 2.348. Parameters

pMemBuf	A pointer to a memory buffer structure.
---------	---

Returns: . Length of trimmed buffer.

Print Functions

Detailed Description

These functions simply print the output in a "name=value" format. The value format is obtained by calling one of the ToString functions with the given value.

Functions

- void rtxPrintBoolean (const char * name, OSBOOL value)
- void rtxPrintDate (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintTime (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintDateTime (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintGYear (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintGYearMonth (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintGMonth (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintGMonthDay (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintGDay (const char * name, const OSNumDateTime * pvalue)
- void rtxPrintInteger (const char * name, OSINT32 value)
- void rtxPrintInt64 (const char * name, OSINT64 value)
- void rtxPrintIpv4Addr (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintIpv6Addr (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintTBCDStr (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintText (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintUnsigned (const char * name, OSUINT32 value)
- void rtxPrintUInt64 (const char * name, OSUINT64 value)
- void rtxPrintHexStr (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintHexStrPlain (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintHexStrNoAscii (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintHexBinary (const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintCharStr (const char * name, const char * cstring)
- void rtxPrintUTF8CharStr (const char * name, const OSUTF8CHAR * cstring)

- void rtxPrintUnicodeCharStr (const char * name, const OSUNICHAR * str, int nchars)
- void rtxPrintUnicodeCharStr64 (const char * name, const OSUNICHAR * str, OSSIZE nchars)
- void rtxPrintReal (const char * name, OSREAL value)
- void rtxPrintNull (const char * name)
- void rtxPrintNVP (const char * name, const OSUTF8NVP * value)
- int rtxPrintFile (const char * filename)
- void rtxPrintIndent (OSVOIDARG)
- void rtxPrintIncrIndent (OSVOIDARG)
- void rtxPrintDecrIndent (OSVOIDARG)
- void rtxPrintCloseBrace (OSVOIDARG)
- void rtxPrintOpenBrace (const char *)

Function Documentation

void rtxPrintBoolean (const char *name, OSBOOL value)

Prints a boolean value to stdout.

Table 2.349. Parameters

name	The name of the variable to print.
value	Boolean value to print.

void rtxPrintDate (const char *name, const OSNumDateTime *pvalue)

Prints a date value to stdout.

Table 2.350. Parameters

name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintTime (const char *name, const OSNumDateTime *pvalue)

Prints a time value to stdout.

Table 2.351. Parameters

name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintDateTime (const char *name, const OSNumDateTime *pvalue)

Prints a dateTime value to stdout.

Table 2.352. Parameters

name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintInteger (const char *name, OSINT32 value)

Prints an integer value to stdout.

Table 2.353. Parameters

name	The name of the variable to print.
value	Integer value to print.

void rtxPrintInt64 (const char *name, OSINT64 value)

Prints a 64-bit integer value to stdout.

Table 2.354. Parameters

name	The name of the variable to print.
value	64-bit integer value to print.

void rtxPrintIpv4Addr (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in IPv4 address format to standard output.

Table 2.355. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintIpv6Addr (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in IPv6 address format to standard output.

Table 2.356. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintTBCDStr (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in TBCD format to standard output.

Table 2.357. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintText (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in ASCII text format to standard output.

Table 2.358. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintUnsigned (const char *name, OSUINT32 value)

Prints an unsigned integer value to stdout.

Table 2.359. Parameters

name	The name of the variable to print.
value	Unsigned integer value to print.

void rtxPrintUInt64 (const char *name, OSUINT64 value)

Prints an unsigned 64-bit integer value to stdout.

Table 2.360. Parameters

name	The name of the variable to print.
value	Unsigned 64-bit integer value to print.

void rtxPrintHexStr (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. If the string is 32 bytes or less, it is printed on a single line with a '0x' prefix. If longer, a formatted hex dump showing both hex and ascii codes is done.

Table 2.361. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintHexStrPlain (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. In contrast to rtxPrintHexStr, it is always printed on a single line with a '0x' prefix.

Table 2.362. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintHexStrNoAscii (const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. In contrast to rtxPrintHexStr, it never contains an ASCII dump.

Table 2.363. Parameters

name	The name of the variable to print.
------	------------------------------------

numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintHexBinary (const char *name, OSSIZE numocts, const OSOCTET *data)

Prints an octet string value in hex binary format to stdout.

Table 2.364. Parameters

name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintCharStr (const char *name, const char *cstring)

Prints an ASCII character string value to stdout.

Table 2.365. Parameters

name	The name of the variable to print.
cstring	A pointer to the character string to be printed.

void rtxPrintUTF8CharStr (const char *name, const OSUTF8CHAR *cstring)

Prints a UTF-8 encoded character string value to stdout.

Table 2.366. Parameters

name	The name of the variable to print.
cstring	A pointer to the character string to be printed.

void rtxPrintUnicodeCharStr (const char *name, const OSUNICHAR *str, int nchars)

This function prints a Unicode string to standard output. Characters in the string that are within the normal Ascii range are printed as single characters. Characters outside the Ascii range are printed as 4-byte hex codes (0xnxxx).

Table 2.367. Parameters

name	The name of the variable to print.
------	------------------------------------

str	Pointer to unicode string to be printed. String is an array of C unsigned short data variables.
nchars	Number of characters in the string. If value is negative, string is assumed to be null-terminated (i.e. ends with a 0x0000 character).

void rtxPrintReal (const char *name, OSREAL value)

Prints a REAL (float, double, decimal) value to stdout.

Table 2.368. Parameters

name	The name of the variable to print.
value	REAL value to print.

void rtxPrintNull (const char *name)

Prints a NULL value to stdout.

Table 2.369. Parameters

name	The name of the variable to print.
------	------------------------------------

void rtxPrintNVP (const char *name, const OSUTF8NVP *value)

Prints a name-value pair to stdout.

Table 2.370. Parameters

name	The name of the variable to print.
value	A pointer to name-value pair structure to print.

int rtxPrintFile (const char *filename)

This function prints the contents of a text file to stdout.

Table 2.371. Parameters

filename	The name of the text file to print.
----------	-------------------------------------

Returns: . Status of operation, 0 if success.

void rtxPrintIndent (OSVOIDARG)

This function prints indentation spaces to stdout.

void rtxPrintIncrIndent (OSVOIDARG)

This function increments the current indentation level.

void rtxPrintDecrIndent (OSVOIDARG)

This function decrements the current indentation level.

void rtxPrintCloseBrace (OSVOIDARG)

This function closes a braced region by decreasing the indent level, printing indent spaces, and printing the closing brace.

void rtxPrintOpenBrace (const char *)

This function opens a braced region by printing indent spaces, printing the name and opening brace, and increasing the indent level.

Print-To-Stream Functions

Detailed Description

These functions print typed data in a "name=value" format. The output is redirected to the print stream defined within the context or to a global print stream. Print streams are set using the rtxSetPrintStream or rtxSetGlobalPrintStream function.

Functions

- void rtxPrintToStreamBoolean (OSCTXT * pctxt, const char * name, OSBOOL value)
- void rtxPrintToStreamDate (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamTime (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamDateTime (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamGYear (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamGYearMonth (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamGMonth (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamGMonthDay (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamGDay (OSCTXT * pctxt, const char * name, const OSNumDateTime * pvalue)
- void rtxPrintToStreamInteger (OSCTXT * pctxt, const char * name, OSINT32 value)
- void rtxPrintToStreamInt64 (OSCTXT * pctxt, const char * name, OSINT64 value)
- void rtxPrintToStreamUnsigned (OSCTXT * pctxt, const char * name, OSUINT32 value)
- void rtxPrintToStreamUInt64 (OSCTXT * pctxt, const char * name, OSUINT64 value)
- void rtxPrintToStreamHexStr (OSCTXT * pctxt, const char * name, OSSIZE numocts, const OSOCTET * data)

- void rtxPrintToStreamHexStrPlain (OSCTXT * pctxt, const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintToStreamHexStrNoAscii (OSCTXT * pctxt, const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintToStreamHexBinary (OSCTXT * pctxt, const char * name, OSSIZE numocts, const OSOCTET * data)
- void rtxPrintToStreamCharStr (OSCTXT * pctxt, const char * name, const char * cstring)
- void rtxPrintToStreamUTF8CharStr (OSCTXT * pctxt, const char * name, const OSUTF8CHAR * cstring)
- void rtxPrintToStreamUnicodeCharStr (OSCTXT * pctxt, const char * name, const OSUNICHAR * str, int nchars)
- void rtxPrintToStreamReal (OSCTXT * pctxt, const char * name, OSREAL value)
- void rtxPrintToStreamNull (OSCTXT * pctxt, const char * name)
- void rtxPrintToStreamNVP (OSCTXT * pctxt, const char * name, const OSUTF8NVP * value)
- int rtxPrintToStreamFile (OSCTXT * pctxt, const char * filename)
- void rtxPrintToStreamIndent (OSCTXT * pctxt)
- void rtxPrintToStreamResetIndent (OSCTXT * pctxt)
- void rtxPrintToStreamIncrIndent (OSCTXT * pctxt)
- void rtxPrintToStreamDecrIndent (OSCTXT * pctxt)
- void rtxPrintToStreamCloseBrace (OSCTXT * pctxt)
- void rtxPrintToStreamOpenBrace (OSCTXT * pctxt, const char *)
- void rtxHexDumpToStream (OSCTXT * pctxt, const OSOCTET * data, OSSIZE numocts)
- void rtxHexDumpToStreamEx (OSCTXT * pctxt, const OSOCTET * data, OSSIZE numocts, OSSIZE bytesPerUnit)
- void rtxHexDumpToStreamExNoAscii (OSCTXT * pctxt, const OSOCTET * data, OSSIZE numocts, OSSIZE bytesPerUnit)

Function Documentation

void rtxPrintToStreamBoolean (OSCTXT *pctxt, const char *name, OSBOOL value)

Prints a boolean value to a print stream.

Table 2.372. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
value	Boolean value to print.

void rtxPrintToStreamDate (OSCTXT *pctx, const char *name, const OSNumDateTime *pvalue)

Prints a date value to a print stream.

Table 2.373. Parameters

pctx	A pointer to a context structure.
name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintToStreamTime (OSCTXT *pctx, const char *name, const OSNumDateTime *pvalue)

Prints a time value to a print stream.

Table 2.374. Parameters

pctx	A pointer to a context structure.
name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintToStreamDateTime (OSCTXT *pctx, const char *name, const OSNumDateTime *pvalue)

Prints a dateTime value to a print stream.

Table 2.375. Parameters

pctx	A pointer to a context structure.
name	Name of the variable to print.
pvalue	Pointer to a structure that holds numeric DateTime value to print.

void rtxPrintToStreamInteger (OSCTXT *pctx, const char *name, OSINT32 value)

Prints an integer value to a print stream.

Table 2.376. Parameters

pctx	A pointer to a context structure.
------	-----------------------------------

name	The name of the variable to print.
value	Integer value to print.

void rtxPrintToStreamInt64 (OSCTXT *pctx, const char *name, OSINT64 value)

Prints a 64-bit integer value to a print stream.

Table 2.377. Parameters

pctx	A pointer to a context structure.
name	The name of the variable to print.
value	64-bit integer value to print.

void rtxPrintToStreamUnsigned (OSCTXT *pctx, const char *name, OSUINT32 value)

Prints an unsigned integer value to a print stream.

Table 2.378. Parameters

pctx	A pointer to a context structure.
name	The name of the variable to print.
value	Unsigned integer value to print.

void rtxPrintToStreamUInt64 (OSCTXT *pctx, const char *name, OSUINT64 value)

Prints an unsigned 64-bit integer value to a print stream.

Table 2.379. Parameters

pctx	A pointer to a context structure.
name	The name of the variable to print.
value	Unsigned 64-bit integer value to print.

void rtxPrintToStreamHexStr (OSCTXT *pctx, const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. If the string is 32 bytes or less, it is printed on a single line with a '0x' prefix. If longer, a formatted hex dump showing both hex and ascii codes is done.

Table 2.380. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintToStreamHexStrPlain (OSCTXT *pctxt, const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. In contrast to rtxPrintToStreamHexStr, it is always printed on a single line with a '0x' prefix.

Table 2.381. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintToStreamHexStrNoAscii (OSCTXT *pctxt, const char *name, OSSIZE numocts, const OSOCTET *data)

This function prints the value of a binary string in hex format to standard output. In contrast to rtxPrintToStreamHexStr, it contains no ASCII output, but instead is a formatted block of hex text printed on multiple lines if needed.

Table 2.382. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
numocts	The number of octets to be printed.
data	A pointer to the data to be printed.

void rtxPrintToStreamHexBinary (OSCTXT *pctxt, const char *name, OSSIZE numocts, const OSOCTET *data)

Prints an octet string value in hex binary format to a print stream.

Table 2.383. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
numocts	The number of octets to be printed.

data	A pointer to the data to be printed.
------	--------------------------------------

void rtxPrintToStreamCharStr (OSCTXT *pctxt, const char *name, const char *cstring)

Prints an ASCII character string value to a print stream.

Table 2.384. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
cstring	A pointer to the character string to be printed.

void rtxPrintToStreamUTF8CharStr (OSCTXT *pctxt, const char *name, const OSUTF8CHAR *cstring)

Prints a UTF-8 encoded character string value to a print stream.

Table 2.385. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
cstring	A pointer to the character string to be printed.

void rtxPrintToStreamUnicodeCharStr (OSCTXT *pctxt, const char *name, const OSUNICHAR *str, int nchars)

This function prints a Unicode string to standard output. Characters in the string that are within the normal Ascii range are printed as single characters. Characters outside the Ascii range are printed as 4-byte hex codes (0xnxxx).

Table 2.386. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
str	Pointer to unicode string to be printed. String is an array of C unsigned short data variables.
nchars	Number of characters in the string. If value is negative, string is assumed to be null-terminated (i.e. ends with a 0x0000 character).

void rtxPrintToStreamReal (OSCTXT *pctxt, const char *name, OSREAL value)

Prints a REAL (float, double, decimal) value to a print stream.

Table 2.387. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
value	REAL value to print.

void rtxPrintToStreamNull (OSCTXT *pctxt, const char *name)

Prints a NULL value to a print stream.

Table 2.388. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.

void rtxPrintToStreamNVP (OSCTXT *pctxt, const char *name, const OSUTF8NVP *value)

Prints a name-value pair to a print stream.

Table 2.389. Parameters

pctxt	A pointer to a context structure.
name	The name of the variable to print.
value	A pointer to name-value pair structure to print.

int rtxPrintToStreamFile (OSCTXT *pctxt, const char *filename)

This function prints the contents of a text file to a print stream.

Table 2.390. Parameters

pctxt	A pointer to a context structure.
filename	The name of the text file to print.

Returns: . Status of operation, 0 if success.

void rtxPrintToStreamIndent (OSCTXT *pctxt)

This function prints indentation spaces to a print stream.

void rtxPrintToStreamResetIndent (OSCTXT *pctxt)

This function resets the current indentation level to zero.

Table 2.391. Parameters

pctxt	A pointer to a context data structure that holds the print stream.
-------	--

void rtxPrintToStreamIncrIndent (OSCTXT *pctxt)

This function increments the current indentation level.

Table 2.392. Parameters

pctxt	A pointer to a context data structure that holds the print stream.
-------	--

void rtxPrintToStreamDecrIndent (OSCTXT *pctxt)

This function decrements the current indentation level.

Table 2.393. Parameters

pctxt	A pointer to a context data structure that holds the print stream.
-------	--

void rtxPrintToStreamCloseBrace (OSCTXT *pctxt)

This function closes a braced region by decreasing the indent level, printing indent spaces, and printing the closing brace.

void rtxPrintToStreamOpenBrace (OSCTXT *pctxt, const char *)

This function opens a braced region by printing indent spaces, printing the name and opening brace, and increasing the indent level.

void rtxHexDumpToStream (OSCTXT *pctxt, const OSOCTET *data, OSSIZE numocts)

This function outputs a hexadecimal dump of the current buffer contents to a print stream.

Table 2.394. Parameters

pctxt	A pointer to a context structure.
data	The pointer to a buffer to be displayed.
numocts	The number of octets to be displayed

void rtxHexDumpToStreamEx (OSCTXT *pctxt, const OSOCTET *data, OSSIZE numocts, OSSIZE bytesPerUnit)

This function outputs a hexadecimal dump of the current buffer to a print stream, but it may output the dump as an array of bytes, words, or double words.

Table 2.395. Parameters

pctxt	A pointer to a context structure.
data	The pointer to a buffer to be displayed.
numocts	The number of octets to be displayed.
bytesPerUnit	The number of bytes in one unit. May be 1 (byte), 2 (word), or 4 (double word).

void rtxHexDumpToStreamExNoAscii (OSCTXT *pctxt, const OSOCTET *data, OSSIZE numocts, OSSIZE bytesPerUnit)

This function outputs a formatted hexadecimal dump of the current buffer to a print stream. It outputs the dump as an array of bytes, words, or double words. It does not output any ASCII equivalent.

Table 2.396. Parameters

pctxt	A pointer to a context structure.
data	The pointer to a buffer to be displayed.
numocts	The number of octets to be displayed.
bytesPerUnit	The number of bytes in one unit. May be 1 (byte), 2 (word), or 4 (double word).

TCP/IP or UDP socket utility functions

- `#define OSIPADDR_LOCAL ((OSIPADDR)0x7f000001UL) /* 127.0.0.1 */`

Typedef Documentation

typedef unsigned long OSIPADDR

The IP address represented as unsigned long value. The most significant 8 bits in this unsigned long value represent the first number of the IP address. The least significant 8 bits represent the last number of the IP address.

Function Documentation

int rtxSocketAccept (OSRTSOCKET socket, OSRTSOCKET *pNewSocket, OSIPADDR *destAddr, int *destPort)

This function permits an incoming connection attempt on a socket. It extracts the first connection on the queue of pending connections on socket. It then creates a new socket and returns a handle to the new socket. The newly created socket is the socket that will handle the actual connection and has the same properties as original socket. See description of 'accept' socket function for further details.

Table 2.397. Parameters

socket	The socket handle created by call to rtxSocketCreate function.
pNewSocket	The pointer to variable to receive the new socket handle.
destAddr	Optional pointer to a buffer that receives the IP address of the connecting entity. It may be NULL.
destPort	Optional pointer to a buffer that receives the port of the connecting entity. It may be NULL.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketAddrToStr (OSIPADDR ipAddr, char *pbuf, size_t bufsize)

This function converts an IP address to its string representation.

Table 2.398. Parameters

ipAddr	The IP address to be converted.
pbuf	Pointer to the buffer to receive a string with the IP address.
bufsize	Size of the buffer.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketBind (OSRTSOCKET socket, OSIPADDR addr, int port)

This function associates a local address with a socket. It is used on an unconnected socket before subsequent calls to the rtxSocketConnect or rtxSocketListen functions. See description of 'bind' socket function for further details.

Table 2.399. Parameters

socket	The socket handle created by call to rtxSocketCreate function.
addr	The local IP address to assign to the socket.
port	The local port number to assign to the socket.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketClose (OSRTSOCKET socket)

This function closes an existing socket.

Table 2.400. Parameters

socket	The socket handle created by call to rtxSocketCreate or rtxSocketAccept function.
--------	---

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketConnect (OSRTSOCKET socket, const char *host, int port)

This function establishes a connection to a specified socket. It is used to create a connection to the specified destination. When the socket call completes successfully, the socket is ready to send and receive data. See description of 'connect' socket function for further details.

Table 2.401. Parameters

socket	The socket handle created by call to rtxSocketCreate function.
host	The null-terminated string with the IP address in the following format: "NNN.NNN.NNN.NNN", where NNN is a number in the range (0..255).
port	The destination port to connect.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketConnectTimed (OSRTOCKET socket, const char *host, int port, int nsecs)

This function establishes a connection to a specified socket. It is similar to the rtxSocketConnect function except that it will only wait the given number of seconds to establish a connection before giving up.

Table 2.402. Parameters

socket	The socket handle created by call to rtxSocketCreate function.
host	The null-terminated string with the IP address in the following format: "NNN.NNN.NNN.NNN", where NNN is a number in the range (0..255).
port	The destination port to connect.
nsecs	Number of seconds to wait before failing.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketCreate (OSRTOCKET *psocket)

This function creates a TCP socket.

Table 2.403. Parameters

psocket	The pointer to the socket handle variable to receive the handle of new socket.
---------	--

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketGetHost (const char *host, struct in_addr *inaddr)

This function resolves the given host name to an IP address. The resulting address is stored in the given socket address structure.

Table 2.404. Parameters

host	Host name to resolve
------	----------------------

inaddr	Socket address structure to receive resolved IP address
--------	---

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketsInit (OSVOIDARG)

This function initiates use of sockets by an application. This function must be called first before use sockets.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketListen (OSRTSOCKET socket, int maxConnection)

This function places a socket a state where it is listening for an incoming connection. To accept connections, a socket is first created with the rtxSocketCreate function and bound to a local address with the rtxSocketBind function, a maxConnection for incoming connections is specified with rtxSocketListen, and then the connections are accepted with the rtxSocketAccept function. See description of 'listen' socket function for further details.

Table 2.405. Parameters

socket	The socket handle created by call to rtxSocketCreate function.
maxConnection	Maximum length of the queue of pending connections.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketParseURL (char *url, char **protocol, char **address, int *port)

This function parses a simple URL of the form <protocol>://<address>:<port> into its individual components. It is assumed that the buffer the URL is provided in is modifiable. Null-terminators are inserted in the buffer to delimit the individual components. If the user needs to use the URL in unparsed form for any other purpose, they will need to make a copy of it before calling this function.

Table 2.406. Parameters

url	URL to be parsed. Buffer will be altered.
protocol	Protocol string parsed from the URL.
address	IP address or domain name parsed from URL.
port	Optional port number. Zero if no port provided.

Returns: . Zero if parse successful or negative error code.

int rtxSocketRecv (OSRTSOCKET socket, OSOCTET *pbuf, size_t bufsize)

This function receives data from a connected socket. It is used to read incoming data on sockets. The socket must be connected before calling this function. See description of 'recv' socket function for further details.

Table 2.407. Parameters

socket	The socket handle created by call to rtxSocketCreate or rtxSocketAccept function.
pbuf	Pointer to the buffer for the incoming data.
bufsize	Length of the buffer.

Returns: . If no error occurs, returns the number of bytes received. Otherwise, the negative value is error code. RTERR_WOULDBLOCK is returned if the socket is non-blocking and 0 bytes were available without blocking.

int rtxSocketRecvTimed (OSRTSOCKET socket, OSOCKET *pbuf, size_t bufsize, OSUINT32 secs)

This function receives data from a connected socket on a timed basis. It is used to read incoming data on sockets. The socket must be connected before calling this function. If no data is available within the given timeout period, an error is returned. See description of 'recv' socket function for further details.

Table 2.408. Parameters

socket	The socket handle created by call to rtxSocketCreate or rtxSocketAccept function.
pbuf	Pointer to the buffer for the incoming data.
bufsize	Length of the buffer. secs Amount of time to wait, in seconds, for data to be received.

Returns: . If no error occurs, returns the number of bytes received. Otherwise, the negative value is error code.

int rtxSocketSelect (int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, struct timeval *timeout)

This function is used for synchronous monitoring of multiple sockets. For more information refer to documentation of the "select" system call.

Table 2.409. Parameters

nfds	The highest numbered descriptor to be monitored plus one.
readfds	The descriptors listed in readfds will be watched for whether read would block on them.
writefds	The descriptors listed in writefds will be watched for whether write would block on them.
exceptfds	The descriptors listed in exceptfds will be watched for exceptions.
timeout	Upper bound on amount of time elapsed before select returns.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxSocketSend (OSRTSOCKET socket, const OSOCKET *pdata, size_t size)

This function sends data on a connected socket. It is used to write outgoing data on a connected socket. See description of 'send' socket function for further details.

Table 2.410. Parameters

socket	The socket handle created by call to <code>rtxSocketCreate</code> or <code>rtxSocketAccept</code> function.
pdata	Buffer containing the data to be transmitted.
size	Length of the data in pdata.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketSetBlocking (OSRTOCKET socket, OSBOOL value)

This function turns blocking mode for a socket on or off.

Table 2.411. Parameters

socket	The socket handle created by call to <code>rtxSocketCreate</code> or <code>rtxSocketAccept</code> function.
value	Boolean value. True = turn blocking mode on.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxSocketStrToAddr (const char *pIPAddrStr, OSIPADDR *pIPAddr)

This function converts the string with IP address to a double word representation. The converted address may be used with the `rtxSocketBind` function.

Table 2.412. Parameters

pIPAddrStr	The null-terminated string with the IP address in the following format: "NNN.NNN.NNN.NNN", where NNN is a number in the range (0..255).
pIPAddr	Pointer to the converted IP address.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

Input/Output Data Stream Utility Functions

Detailed Description

Stream functions are used for unbuffered stream operations. All of the operations with streams are performed using a context block to maintain state information.

These functions may be used for any input/output operations with streams. Each stream should be initialized first by call to the `rtxStreamInit` function. After initialization, the stream may be opened for reading or writing by calling one of the following functions:

- `rtxStreamFileOpen`

- `rtxStreamFileAttach`
- `rtxStreamSocketAttach`
- `rtxStreamMemoryCreate`
- `rtxStreamMemoryAttach`

Classes

- `struct OSRTSTREAM`

Typedefs

- `typedef long(* OSRTStreamReadProc`
- `typedef OSRTStreamReadProc OSRTStreamBlockingReadProc`
- `typedef long(* OSRTStreamWriteProc`
- `typedef int(* OSRTStreamFlushProc`
- `typedef int(* OSRTStreamCloseProc`
- `typedef int(* OSRTStreamSkipProc`
- `typedef int(* OSRTStreamMarkProc`
- `typedef int(* OSRTStreamResetProc`
- `typedef int(* OSRTStreamGetPosProc`
- `typedef int(* OSRTStreamSetPosProc`
- `typedef struct OSRTSTREAM OSRTSTREAM`

Functions

- `int rtxStreamClose (OSCTXT * pctxt)`
- `int rtxStreamFlush (OSCTXT * pctxt)`
- `int rtxStreamLoadInputBuffer (OSCTXT * pctxt, OSSIZE nbytes)`
- `int rtxStreamInit (OSCTXT * pctxt)`
- `int rtxStreamInitCtxtBuf (OSCTXT * pctxt)`
- `int rtxStreamRemoveCtxtBuf (OSCTXT * pctxt)`
- `long rtxStreamRead (OSCTXT * pctxt, OSOCTET * pBuffer, size_t nocts)`
- `long rtxStreamReadDirect (OSCTXT * pctxt, OSOCTET * pBuffer, OSSIZE bufSize)`
- `int rtxStreamSkip (OSCTXT * pctxt, size_t skipBytes)`
- `long rtxStreamWrite (OSCTXT * pctxt, const OSOCTET * data, size_t numocts)`

- `#define OSRTSTREAM_ID ((pctxt)->pStream->id)`
- `#define OSRTSTREAM_FLAGS ((pctxt)->pStream->flags)`
- `#define rtxStreamBlockingRead rtxStreamRead`

Typedef Documentation

typedef long(* OSRTStreamReadProc) (struct OSRTSTREAM *pStream, OSOCTET *pbuffer, size_t nocts)

Stream read function pointer type. A user may implement a customized read function for specific input streams. The read function is defined in the OSRTSTREAM control structure.

The read function may read fewer bytes than requested, but it will read at least one byte (assuming nocts > 0) unless EOF is reached or there is an error. Thus, if nocts > 0, this will return 0 only if EOF is reached. Reaching EOF shall not be considered an error.

Table 2.413. Parameters

pStream	Identifies the stream control structure.
pbuffer	is the buffer into which bytes shall be read.
nocts	is the number of bytes to be read; the buffer must be at least this large.

Returns: . The number of bytes read (possibly 0), or a negative error code.

typedef OSRTStreamReadProc OSRTStreamBlockingReadProc

OSRTStreamBlockingReadProc is deprecated. Use OSRTStreamReadProc.

typedef long(* OSRTStreamWriteProc) (struct OSRTSTREAM *pStream, const OSOCTET *data, size_t numocts)

Stream write function pointer type. A user may implement a customized write function for any specific output streams. The write function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamFlushProc) (struct OSRTSTREAM *pStream)

Stream flush function pointer type. A user may implement a customized flush function for any specific output streams. The flush function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamCloseProc) (struct OSRTSTREAM *pStream)

Stream close function pointer type. A user may implement a customized close function for any specific input or output streams. The close function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamSkipProc) (struct OSRTSTREAM *pStream, size_t skipBytes)

Stream skip function pointer type. A user may implement a customized function for a specific input stream type. The skip function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamMarkProc) (struct OSRTSTREAM *pStream, size_t readAheadLimit)

Stream mark function pointer type. A user may implement a customized function for a specific input stream type. The mark function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamResetProc) (struct OSRTSTREAM *pStream)

Stream reset function pointer type. A user may implement a customized function for a specific input stream type. The reset function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamGetPosProc) (struct OSRTSTREAM *pStream, size_t *ppos)

Stream get position function pointer type. A user may implement a customized function for a specific input stream type. The mark function is defined in the OSRTSTREAM control structure.

typedef int(* OSRTStreamSetPosProc) (struct OSRTSTREAM *pStream, size_t pos)

Stream set position function pointer type. A user may implement a customized function for a specific input stream type. The mark function is defined in the OSRTSTREAM control structure.

typedef struct OSRTSTREAM OSRTSTREAM

The stream control block. A user may implement a customized stream by defining read, skip, close functions for input streams and write, flush, close for output streams.

Function Documentation

int rtxStreamClose (OSCTXT *pctxt)

This function closes the input or output stream and releases any system resources associated with the stream. For output streams this function also flushes all internal buffers to the stream.

Table 2.414. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to <code>rtxStreamInit</code> .
-------	---

int rtxStreamFlush (OSCTXT *pctxt)

This function flushes the output stream and forces any buffered output octets to be written out.

Table 2.415. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to <code>rtxStreamInit</code> .
-------	---

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamLoadInputBuffer (OSCTXT *pctxt, OSSIZE nbytes)

This is for meant for internal use by the runtime.

Read at least as many bytes, from the context's input stream into the context buffer, as necessary to make nbytes of data available in the context buffer.

Upon return, `pctxt.buffer.byteIndex + nbytes <= pctxt.buffer.size` OR EOF has been reached OR an error has been logged and is being returned.

If the context buffer has not been created, this will create it. If the context buffer needs to be made larger, this will enlarge it or else log, and return, an error.

Any bytes read from the stream will be sent to the capture buffer, if there is one.

Table 2.416. Parameters

pctxt	A context with an attached stream using the context's buffer as a buffer for the stream.
-------	--

Returns: . 0 or or negative error. EOF is not considered an error.

int rtxStreamInit (OSCTXT *pctxt)

This function initializes a stream part of the context block. This function should be called first before any operation with a stream.

Table 2.417. Parameters

pctxt	Pointer to context structure variable, for which stream to be initialized.
-------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamInitCtxtBuf (OSCTXT *pctxt)

This function initializes a stream to use the context memory buffer for stream buffering.

Table 2.418. Parameters

pctxt	Pointer to context structure variable, for which stream to be initialized.
-------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamRemoveCtxtBuf (OSCTXT *pctxt)

This function removes the use of a context memory buffer from a stream.

Table 2.419. Parameters

pctxt	Pointer to context structure variable which is assumed to contain an initialized stream with context buffering enabled.
-------	---

Returns: . Completion status of operation: 0 = success, negative return value is error.

long rtxStreamRead (OSCTXT *pctxt, OSOCTET *pbuffer, size_t nocts)

Read up to nocts bytes of data from the input stream into an array of octets.

This function blocks until nocts of data are read, end of file is detected, or an error occurs. EOF is not treated as an error.

Table 2.420. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to rtxStreamInit.
pbuffer	Pointer to a buffer to receive data.
bufSize	Size of the buffer.

Returns: . The total number of octets read into pbuffer, or negative value with error code if an error occurs.

int rtxStreamSkip (OSCTXT *pctxt, size_t skipBytes)

This function skips over and discards the specified amount of data octets from this input stream.

Table 2.421. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to rtxStreamInit.
skipBytes	The number of octets to be skipped.

Returns: . Completion status of operation: 0 = success, negative return value is error.

long rtxStreamWrite (OSCTXT *pctxt, const OSOCTET *data, size_t numocts)

This function writes the specified amount of octets from the specified array to the output stream.

Table 2.422. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to rtxStreamInit.
data	The pointer to data to be written.
numocts	The number of octets to write.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamGetIOBytes (OSCTXT *pctxt, size_t *pPos)

This function returns the number of processed octets. If the stream was opened as an input stream, then it returns the total number of read octets. If the stream was opened as an output stream, then it returns the total number of written octets. Otherwise, this function returns an error code.

Table 2.423. Parameters

pctxt	Pointer to a context structure variable which has been initialized for stream operations via a call to rtxStreamInit.
pPos	Pointer to argument to receive total number of processed octets.

Returns: . The total number of processed octets or error code (negative value).

int rtxStreamMark (OSCTXT *pctxt, size_t readAheadLimit)

Marks the current position in this input stream. A subsequent call to the rtxStreamReset function repositions this stream at the last marked position so that subsequent reads re-read the same bytes. The readAheadLimit argument tells this input stream to allow many bytes to be read before the mark position gets invalidated.

Table 2.424. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
readAheadLimit	The maximum limit of bytes that can be read before the mark position becomes invalid.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamReset (OSCTXT *pctxt)

Repositions this stream to the position recorded by the last call to the rtxStreamMark function.

Table 2.425. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

OSBOOL rtxStreamMarkSupported (OSCTXT *pctxt)

Tests if this input stream supports the mark and reset methods. Whether or not mark and reset are supported is an invariant property of a particular input stream instance. By default, it returns FALSE.

Table 2.426. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . TRUE if this stream instance supports the mark and reset methods; FALSE otherwise.

OSBOOL rtxStreamIsOpened (OSCTXT *pctxt)

Tests if this stream opened (for reading or writing).

Table 2.427. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . TRUE if this stream is opened for reading or writing; FALSE otherwise.

OSBOOL rtxStreamIsReadable (OSCTXT *pctxt)

Tests if this stream opened for reading.

Table 2.428. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . TRUE if this stream is opened for reading; FALSE otherwise.

OSBOOL rtxStreamIsWritable (OSCTXT *pctxt)

Tests if this stream opened for writing.

Table 2.429. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . TRUE if this stream is opened for writing; FALSE otherwise.

int rtxStreamRelease (OSCTXT *pctxt)

This function releases the stream's resources. If it is opened for reading or writing it will be closed.

Table 2.430. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

void rtxStreamSetCapture (OSCTXT *pctxt, OSRTMEMBUF *pmembuf)

This function sets a capture buffer for the stream. This is used to record all data read from the stream.

Table 2.431. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pmembuf	Pointer to an initialized memory buffer structure. This argument may be set to NULL to disable capture if previously set.

OSRTMEMBUF* rtxStreamGetCapture (OSCTXT *pctxt)

This function returns the capture buffer currently assigned to the stream.

Table 2.432. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . Pointer to memory buffer that was previously assigned as a capture buffer to the stream.

int rtxStreamGetPos (OSCTXT *pctxt, size_t *ppos)

Get the current position in input stream.

Table 2.433. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
ppos	Pointer to a variable to receive position.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamSetPos (OSCTXT *pctxt, size_t pos)

Set the current position in input stream.

Table 2.434. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pos	Stream position.

Returns: . Completion status of operation: 0 = success, negative return value is error.

Macro Definition Documentation

#define rtxStreamBlockingRead

rtxStreamBlockingRead is deprecated. Use rtxStreamRead.

Definition at line 322 of file rtxStream.h

The Documentation for this define was generated from the following file:

- rtxStream.h

File stream functions.

Detailed Description

File stream functions are used for stream operations with files.

Functions

- int rtxStreamFileAttach (OSCTXT * pctxt, FILE * pFile, OSUINT16 flags)
- int rtxStreamFileOpen (OSCTXT * pctxt, const char * pFilename, OSUINT16 flags)
- int rtxStreamFileCreateReader (OSCTXT * pctxt, const char * pFilename)
- int rtxStreamFileCreateWriter (OSCTXT * pctxt, const char * pFilename)

Function Documentation

int rtxStreamFileAttach (OSCTXT *pctxt, FILE *pFile, OSUINT16 flags)

Attaches the existing file structure pointer to the stream. The file should be already opened either for the reading or writing. The 'flags' parameter specifies the access mode for the stream - input or output.

Table 2.435. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pFile	Pointer to FILE structure. File should be already opened either for the writing or reading.
flags	Specifies the access mode for the stream:

- OSRTSTRMF_INPUT = input (reading) stream;
- OSRTSTRMF_OUTPUT = output (writing) stream.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamFileOpen (OSCTXT *pctxt, const char *pFilename, OSUINT16 flags)

Opens a file stream. The 'flags' parameter specifies the access mode for the stream - input or output.

Table 2.436. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pFilename	Pointer to null-terminated string that contains the name of file.
flags	Specifies the access mode for the stream: <ul style="list-style-type: none"> • OSRTSTRMF_INPUT = input (reading) stream; • OSRTSTRMF_OUTPUT = output (writing) stream.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamFileCreateReader (OSCTXT *pctxt, const char *pFilename)

This function creates an input file stream using the specified file name.

Table 2.437. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pFilename	Pointer to null-terminated string that contains the name of file.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamFileCreateWriter (OSCTXT *pctxt, const char *pFilename)

This function creates an output file stream using the file name.

Table 2.438. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pFilename	Pointer to null-terminated string that contains the name of file.

Returns: . Completion status of operation: 0 = success, negative return value is error.

Memory stream functions.

Detailed Description

Memory stream functions are used for memory stream operations.

Functions

- `int rtxStreamMemoryCreate (OSCTXT * pctxt, OSUINT16 flags)`
- `int rtxStreamMemoryAttach (OSCTXT * pctxt, OSOCTET * pMemBuf, size_t bufSize, OSUINT16 flags)`
- `OSOCTET * rtxStreamMemoryGetBuffer (OSCTXT * pctxt, size_t * pSize)`
- `int rtxStreamMemoryCreateReader (OSCTXT * pctxt, OSOCTET * pMemBuf, size_t bufSize)`
- `int rtxStreamMemoryCreateWriter (OSCTXT * pctxt, OSOCTET * pMemBuf, size_t bufSize)`
- `int rtxStreamMemoryResetWriter (OSCTXT * pctxt)`

Function Documentation

`int rtxStreamMemoryCreate (OSCTXT *pctxt, OSUINT16 flags)`

Opens a memory stream. A memory buffer will be created by this function. The 'flags' parameter specifies the access mode for the stream - input or output.

Table 2.439. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
flags	Specifies the access mode for the stream: <ul style="list-style-type: none"> • OSRTSTRMF_INPUT = input (reading) stream; • OSRTSTRMF_OUTPUT = output (writing) stream.

Returns: . Completion status of operation: 0 = success, negative return value is error.

`int rtxStreamMemoryAttach (OSCTXT *pctxt, OSOCTET *pMemBuf, size_t bufSize, OSUINT16 flags)`

Opens a memory stream using the specified memory buffer. The 'flags' parameter specifies the access mode for the stream - input or output.

Table 2.440. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pMemBuf	The pointer to the buffer.

bufSize	The size of the buffer.
flags	Specifies the access mode for the stream: <ul style="list-style-type: none"> • OSRTSTRMF_INPUT = input (reading) stream; • OSRTSTRMF_OUTPUT = output (writing) stream.

Returns: . Completion status of operation: 0 = success, negative return value is error.

OSOCKET* rtxStreamMemoryGetBuffer (OSCTXT *pctxt, size_t *pSize)

This function returns the memory buffer and its size for the given memory stream. The caller of this function is responsible for freeing the memory.

Table 2.441. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pSize	The pointer to size_t to receive the size of buffer.

Returns: . The pointer to memory buffer. NULL, if error occurred.

int rtxStreamMemoryCreateReader (OSCTXT *pctxt, OSOCKET *pMemBuf, size_t bufSize)

This function creates an input memory stream using the specified buffer.

Table 2.442. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pMemBuf	The pointer to the buffer
bufSize	The size of the buffer

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamMemoryCreateWriter (OSCTXT *pctxt, OSOCKET *pMemBuf, size_t bufSize)

This function creates an output memory stream using the specified buffer. If pMemBuf or bufSize is NULL then new buffer will be allocated.

Table 2.443. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
pMemBuf	The pointer to the buffer. Can be NULL - new buffer will be allocated in this case.

bufSize	The size of the buffer. Can be 0 - new buffer will be allocated in this case.
---------	---

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamMemoryResetWriter (OSCTXT *pctx)

This function resets the output memory stream internal buffer to allow it to be overwritten with new data. Memory for the buffer is not freed.

Table 2.444. Parameters

pctx	Pointer to a context structure variable that has been initialized for stream operations.
------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

Socket stream functions.

Detailed Description

Socket stream functions are used for socket stream operations.

Functions

- int rtxStreamSocketAttach (OSCTXT * pctx, OSRTSOCKET socket, OSUINT16 flags)
- int rtxStreamSocketClose (OSCTXT * pctx)
- int rtxStreamSocketCreateWriter (OSCTXT * pctx, const char * host, int port)
- int rtxStreamSocketSetOwnership (OSCTXT * pctx, OSBOOL ownSocket)
- int rtxStreamSocketSetReadTimeout (OSCTXT * pctx, OSUINT32 nsecs)

Function Documentation

int rtxStreamSocketAttach (OSCTXT *pctx, OSRTSOCKET socket, OSUINT16 flags)

Attaches the existing socket handle to the stream. The socket should be already opened and connected. The 'flags' parameter specifies the access mode for the stream - input or output.

Table 2.445. Parameters

pctx	Pointer to a context structure variable that has been initialized for stream operations.
socket	The socket handle created by rtxSocketCreate.
flags	Specifies the access mode for the stream: <ul style="list-style-type: none"> • OSRTSTRMF_INPUT = input (reading) stream;

- OSRTSTRMF_OUTPUT = output (writing) stream.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamSocketClose (OSCTXT *pctxt)

This function closes a socket stream.

Table 2.446. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
-------	--

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamSocketCreateWriter (OSCTXT *pctxt, const char *host, int port)

This function opens a socket stream for writing.

Table 2.447. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
host	Name of host or IP address to which to connect.
port	Port number to which to connect.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamSocketSetOwnership (OSCTXT *pctxt, OSBOOL ownSocket)

This function transfers ownership of the socket to or from the stream instance. The socket will be closed and deleted when the stream is closed or goes out of scope. By default stream socket owns the socket.

Table 2.448. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
ownSocket	Boolean value.

Returns: . Completion status of operation: 0 = success, negative return value is error.

int rtxStreamSocketSetReadTimeout (OSCTXT *pctxt, OSUINT32 nsecs)

This function sets the read timeout value to the given number of seconds. Any read operation attempted on the stream will timeout after this period of time if no data is received.

Table 2.449. Parameters

pctxt	Pointer to a context structure variable that has been initialized for stream operations.
nsecs	Number of seconds to wait before timing out.

Returns: . Completion status of operation: 0 = success, negative return value is error.

Doubly-Linked List Utility Functions

Detailed Description

The doubly-linked list utility functions provide common routines for managing linked lists. These lists are used to model XSD list and repeating element types within the generated code. This list type contains forward and backward pointers allowing the list to be traversed in either direction.

Classes

- struct OSRTDListNode
- struct OSRTDList
- struct OSRTDListBuf
- struct OSRTDListUTF8StrNode

Typedefs

- typedef struct OSRTDListNode OSRTDListNode
- typedef struct OSRTDList OSRTDList
- typedef struct OSRTDListBuf OSRTDListBuf
- typedef struct OSRTDListUTF8StrNode OSRTDListUTF8StrNode
- typedef int(* PEqualsFunc

Functions

- void rxDListInit (OSRTDList * pList)
- OSRTDListNode * rxDListAppend (struct OSCTXT * pctxt, OSRTDList * pList, void * pData)
- OSRTDListNode * rxDListAppendCharArray (struct OSCTXT * pctxt, OSRTDList * pList, size_t length, char * pData)
- OSRTDListNode * rxDListAppendNode (OSRTDList * pList, OSRTDListNode * pListNode)
- OSRTDListNode * rxDListInsert (struct OSCTXT * pctxt, OSRTDList * pList, OSSIZE idx, void * pData)
- OSRTDListNode * rxDListInsertNode (OSRTDList * pList, OSSIZE idx, OSRTDListNode * pListNode)
- OSRTDListNode * rxDListInsertBefore (struct OSCTXT * pctxt, OSRTDList * pList, OSRTDListNode * node, void * pData)

- OSRTDListNode * rtxDListInsertAfter (struct OSCTXT * pctxt, OSRTDList * pList, OSRTDListNode * node, void * pData)
- OSRTDListNode * rtxDListFindByIndex (const OSRTDList * pList, OSSIZE idx)
- OSRTDListNode * rtxDListFindByData (const OSRTDList * pList, void * data)
- OSRTDListNode * rtxDListFindFirstData (const OSRTDList * pList)
- int rtxDListFindIndexByData (const OSRTDList * pList, void * data)
- void rtxDListFreeNode (struct OSCTXT * pctxt, OSRTDList * pList, OSRTDListNode * node)
- void rtxDListRemove (OSRTDList * pList, OSRTDListNode * node)
- void rtxDListFreeNodes (struct OSCTXT * pctxt, OSRTDList * pList)
- void rtxDListFreeAll (struct OSCTXT * pctxt, OSRTDList * pList)
- int rtxDListToArray (struct OSCTXT * pctxt, OSRTDList * pList, void ** ppArray, OSSIZE * pElemCount, OSSIZE elemSize)
- int rtxDListToPointerArray (struct OSCTXT * pctxt, OSRTDList * pList, void *** ppArray, OSSIZE * pElemCount)
- int rtxDListAppendArray (struct OSCTXT * pctxt, OSRTDList * pList, void * pArray, OSSIZE numElements, OSSIZE elemSize)
- int rtxDListAppendArrayCopy (struct OSCTXT * pctxt, OSRTDList * pList, const void * pArray, OSSIZE numElements, OSSIZE elemSize)
- int rtxDListToUTF8Str (struct OSCTXT * pctxt, OSRTDList * pList, OSUTF8CHAR ** ppstr, char sep)
- OSRTDListNode * rtxDListInsertSorted (struct OSCTXT * pctxt, OSRTDList * pList, void * pData, PEqualsFunc equalsFunc, void * sortCtxt)
- OSRTDListNode * rtxDListInsertNodeSorted (OSRTDList * pList, OSRTDListNode * pListNode, PEqualsFunc equalsFunc, void * sortCtxt)

Macros

- #define DLISTBUF_SEG 16

Function Documentation

void rtxDListInit (OSRTDList *pList)

This function initializes a doubly linked list structure. It sets the number of elements to zero and sets all internal pointer values to NULL. A doubly linked-list structure is described by the OSRTDList type. Nodes of the list are of type OSRTDListNode.

Memory for the structures is allocated using the rtxMemAlloc run-time function and is maintained within the context structure that is a required parameter to all rtxDList functions. This memory is released when rtxMemFree is called or the context is released. Unless otherwise noted, all data passed into the list functions is simply stored on the list by value (i.e. a deep-copy of the data is not done).

Table 2.450. Parameters

pList	A pointer to a linked list structure to be initialized.
-------	---

OSRTDListNode* rtxDListAppend (struct OSCTXT *pctxt, OSRTDList *pList, void *pData)

This function appends an item to the linked list structure. The data item is passed into the function as a void pointer that can point to an object of any type. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore, all internal list memory will be released whenever `rtxMemFree` is called. The pointer to the data item itself is stored in the node structure - a copy is not made.

Table 2.451. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pList	A pointer to a linked list structure onto which the data item will be appended.
pData	A pointer to the data item to be appended to the list.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListAppendCharArray (struct OSCTXT *pctxt, OSRTDList *pList, size_t length, char *pData)

This function appends an item to the linked list structure. The data item is passed into the function as a void pointer that can point to an object of any type. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore, all internal list memory will be released whenever `rtxMemFree` is called. The array passed in is copied and a pointer to the copy is stored in the list.

Table 2.452. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pList	A pointer to a linked list structure onto which the data item will be appended.
length	The size of the character array to be appended.
pData	A pointer to the character array.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListAppendNode (OSRTDList *pList, OSRTDListNode *pListNode)

This function appends an `OSRTDListNode` to the linked list structure. The node data is a void pointer that can point to an object of any type. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore,

all internal list memory will be released whenever `rtxMemFree` is called. The pointer to the data item itself is stored in the node structure - a copy is not made.

Table 2.453. Parameters

<code>pList</code>	A pointer to a linked list structure onto which the data item will be appended.
<code>pListNode</code>	A pointer to the node to be appended to the list.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListInsert (struct OSCTXT *pctxt, OSRTDList *pList, OSSIZE idx, void *pData)

This function inserts an item into the linked list structure. The data item is passed into the function as a void pointer that can point to an object of any type. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore, all internal list memory will be released when the `rtxMemFree` function is called.

Table 2.454. Parameters

<code>pctxt</code>	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
<code>pList</code>	A pointer to a linked list structure into which the data item is to be inserted.
<code>idx</code>	Zero-based index into list where the specified item is to be inserted.
<code>pData</code>	A pointer to the data item to be inserted to the list.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListInsertBefore (struct OSCTXT *pctxt, OSRTDList *pList, OSRTDListNode *node, void *pData)

This function inserts an item into the linked list structure before the specified element. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore, all internal list memory will be released when the `rtxMemFree` function is called.

Table 2.455. Parameters

<code>pctxt</code>	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
<code>pList</code>	A pointer to a linked list structure into which the data item is to be inserted.
<code>node</code>	The position in the list where the item is to be inserted. The item will be inserted before this node or appended to the list if node is null.
<code>pData</code>	A pointer to the data item to be inserted to the list.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListInsertAfter (struct OSCTXT *pctx, OSRTDList *pList, OSRTDListNode *node, void *pData)

This function inserts an item into the linked list structure after the specified element. The `rtxMemAlloc` function is used to allocate memory for the list node structure; therefore, all internal list memory will be released when the `rtxMemFree` function is called.

Table 2.456. Parameters

pctx	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pList	A pointer to a linked list structure into which the data item is to be inserted.
node	The position in the list where the item is to be inserted. The item will be inserted after this node or added as the head element if node is null.
pData	A pointer to the data item to be inserted to the list.

Returns: . A pointer to an allocated node structure used to link the given data value into the list.

OSRTDListNode* rtxDListFindByIndex (const OSRTDList *pList, OSSIZE idx)

This function will return the node pointer of the indexed entry in the list.

Table 2.457. Parameters

pList	A pointer to a linked list structure.
idx	Zero-based index into list where the specified item is located. If the list contains fewer items then the index, NULL is returned.

Returns: . A pointer to an allocated linked list node structure. To get the actual data item, the `data` member variable pointer within this structure must be dereferenced.

OSRTDListNode* rtxDListFindByData (const OSRTDList *pList, void *data)

This function will return the node pointer of the given data item within the list or NULL if the item is not found.

Table 2.458. Parameters

pList	A pointer to a linked list structure.
data	Pointer to the data item to search for. Note that comparison of pointer values is done; not the items pointed at by the pointers.

Returns: . A pointer to an allocated linked list node structure.

OSRTDListNode* rtxDListFindFirstData (const OSRTDList *pList)

This function will return the node pointer of the first non-null data item within the list or NULL if there is no node that has non-null data.

Table 2.459. Parameters

pList	A pointer to a linked list structure.
-------	---------------------------------------

Returns: . A pointer to an allocated linked list node structure.

int rtxDListFindIndexByData (const OSRTDList *pList, void *data)

This function will return the index of the given data item within the list or -1 if the item is not found.

Table 2.460. Parameters

pList	A pointer to a linked list structure.
data	Pointer to the data item to search for. Note that comparison of pointer values is done; not the items pointed at by the pointers.

Returns: . Index of item within the list or -1 if not found.

void rtxDListFreeNode (struct OSCTXT *pctxt, OSRTDList *pList, OSRTDListNode *node)

This function will remove the given node from the list and free memory. The data memory is not freed. It might be released when the `rtxMemFree` or `rtFreeContext` function is called with this context.

Table 2.461. Parameters

pctxt	A pointer to a context structure.
pList	A pointer to a linked list structure.
node	Pointer to the list node to be removed.

void rtxDListRemove (OSRTDList *pList, OSRTDListNode *node)

This function will remove the given node from the list. The node memory is not freed. It will be released when the `rtxMemFree` or `rtFreeContext` function is called with this context.

Table 2.462. Parameters

pList	A pointer to a linked list structure.
node	Pointer to the list node to be removed.

void rtxDListFreeNodes (struct OSCTXT *pctx, OSRTDList *pList)

This function will free all of the dynamic memory used to hold the list node pointers. It does not free the data items because it is unknown how the memory was allocated for these items.

Table 2.463. Parameters

pctx	A pointer to a context structure.
pList	A pointer to a linked list structure.

void rtxDListFreeAll (struct OSCTXT *pctx, OSRTDList *pList)

This function will free all of the dynamic memory used to hold the list node pointers and the data items. In this case, it is assumed that the `rtxMemAlloc` function was used to allocate memory for the data items.

Table 2.464. Parameters

pctx	A pointer to a context structure.
pList	A pointer to a linked list structure.

int rtxDListToArray (struct OSCTXT *pctx, OSRTDList *pList, void **ppArray, OSSIZE *pElemCount, OSSIZE elemSize)

This function converts a doubly linked list of *T to a dynamically (or pre-allocated) array of T. The values pointed to are copied to the array. Note: if you have an array of strings to copy to, you should use `rtxDListToPointerArray`.

Table 2.465. Parameters

pctx	A pointer to a context structure.
pList	A pointer to a linked list structure.
ppArray	A pointer to a pointer to the destination array.
pElemCount	A pointer to the number of elements already allocated in <code>ppArray</code> . If <code>pElements</code> is NULL, or <code>pElements</code> is less than the number of nodes in the list, then a new array is allocated and the pointer is stored in <code>ppArray</code> . Memory is allocated via calls to the <code>rtxMemAlloc</code> function.
elemSize	The size of one element in the array. Use the <code>sizeof()</code> operator to pass this parameter.

Returns: . The number of elements in the returned array.

int rtxDListToPointerArray (struct OSCTXT *pctx, OSRTDList *pList, void *ppArray, OSSIZE *pElemCount)**

This function converts a doubly linked list of *T to a dynamically (or pre-allocated) array of *T. The pointers are copied from the list to the array.

Table 2.466. Parameters

pctxt	A pointer to a context structure.
pList	A pointer to a linked list structure.
ppArray	A pointer to a pointer to the array of pointers.
pElemCount	A pointer to the number of elements already allocated in ppArray. If pElements is NULL, or pElements is less than the number of nodes in the list, then a new array is allocated and the pointer is stored in ppArray. Memory is allocated via calls to the rtxMemAlloc function.

Returns: . The number of elements in the returned array.

int rtxDListAppendArray (struct OSCTXT *pctxt, OSRTDList *pList, void *pArray, OSSIZE numElements, OSSIZE elemSize)

This function appends pointers to items in the given array to a doubly linked list structure. The array is assumed to hold an array of values as opposed to pointers. The actual address of each item in the array is stored - a copy of each item is not made.

Table 2.467. Parameters

pctxt	A pointer to a context structure.
pList	A pointer to the linked list structure onto which the array items will be appended.
pArray	A pointer to the source array to be converted.
numElements	The number of elements in the array.
elemSize	The size of one element in the array. Use the sizeof() operator to pass this parameter.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxDListAppendArrayCopy (struct OSCTXT *pctxt, OSRTDList *pList, const void *pArray, OSSIZE numElements, OSSIZE elemSize)

This function appends a copy of each item in the given array to a doubly linked list structure. In this case, the rtxMemAlloc function is used to allocate memory for each item and a copy is made.

Table 2.468. Parameters

pctxt	A pointer to a context structure.
pList	A pointer to the linked list structure onto which the array items will be appended.
pArray	A pointer to the source array to be converted.
numElements	The number of elements in the array.
elemSize	The size of one element in the array. Use the sizeof() operator to pass this parameter.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

int rtxDListToUTF8Str (struct OSCTXT *pctxt, OSRTDList *pList, OSUTF8CHAR **ppstr, char sep)

This function concatenates all of the components in the given list to form a UTF-8 string. The list is assumed to contain null-terminated character string components. The given separator character is inserted after each list component. The `rtxMemAlloc` function is used to allocate memory for the output string.

Table 2.469. Parameters

pctxt	A pointer to a context structure.
pList	A pointer to the linked list structure onto which the array items will be appended.
ppstr	A pointer to a char pointer to hold output string.
sep	Separator character to add between string components.

Returns: . Completion status of operation: 0 (0) = success, negative return value is error.

Linked List Utility Functions

Detailed Description

Singly linked list structures have only a single link pointer and can therefore only be traversed in a single direction (forward). The node structures consume less memory than those of a doubly linked list.

Another difference between the singly linked list implementation and doubly linked lists is that the singly linked list uses conventional memory allocation functions (C malloc and free) for less storage instead of the `rtxMem` functions. Therefore, it is not a requirement to have an initialized context structure to work with these lists. However, performance may suffer if the lists become large due to the use of non-optimized memory management.

Classes

- struct `_OSRTSListNode`
- struct `_OSRTSList`

Typedefs

- typedef struct `_OSRTSListNode` `OSRTSListNode`
- typedef struct `_OSRTSList` `OSRTSList`

Functions

- void `rtxSListInit (OSRTSList * pList)`
- void `rtxSListInitEx (OSCTXT * pctxt, OSRTSList * pList)`
- void `rtxSListFree (OSRTSList * pList)`

- void rtxSListFreeAll (OSRTSList * pList)
- OSRTSList * rtxSListCreate (OSVOIDARG)
- OSRTSList * rtxSListCreateEx (OSCTXT * pctxt)
- OSRTSListNode * rtxSListAppend (OSRTSList * pList, void * pData)
- OSBOOL rtxSListFind (OSRTSList * pList, void * pData)
- void rtxSListRemove (OSRTSList * pList, void * pData)

Function Documentation

void rtxSListInit (OSRTSList *pList)

This function initializes a singly linked list structure. It sets the number of elements to zero and sets all internal pointer values to NULL.

Table 2.470. Parameters

pList	A pointer to a linked list structure to be initialized.
-------	---

void rtxSListInitEx (OSCTXT *pctxt, OSRTSList *pList)

This function is similar to rtxSListInit but it also sets the pctxt (pointer to a context structure member of OSRTSList structure). This context will be used for further memory allocations; otherwise the standard malloc is used.

Table 2.471. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
pList	A pointer to a linked list structure to be initialized.

void rtxSListFree (OSRTSList *pList)

This function removes all nodes from the linked list structure and releases memory that was allocated for storing node structures (OSRTSListNode). The data will not be freed.

Table 2.472. Parameters

pList	A pointer to a linked list onto which the data item is to be appended.
-------	--

void rtxSListFreeAll (OSRTSList *pList)

This function removes all nodes from the linked list structure and releases memory that was allocated for storing node structures (OSRTSListNode). It also frees the data structures which are assumed to have been allocated using the rtxMemAlloc function.

Table 2.473. Parameters

pList	A pointer to a linked list onto which the data item is to be appended.
-------	--

OSRTSList* rtxSListCreate (OSVOIDARG)

This function creates a new linked list structure. It allocates memory for the structure and calls rtxSListInit to initialize the structure.

Returns: . A pointer to the allocated linked list structure.

OSRTSList* rtxSListCreateEx (OSCTXT *pctxt)

The rtxSListAppend function appends an item to linked list structure. The data is passed into the function as a void that can point to an object of any type.

Table 2.474. Parameters

pctxt	A pointer to a context structure. This provides a storage area for the function to store all working variables that must be maintained between function calls.
-------	--

Returns: . A pointer to the allocated linked list structure.

OSRTSListNode* rtxSListAppend (OSRTSList *pList, void *pData)

This function appends an item to a linked list structure. The data item is passed into the function as a void parameter that can point to an object of any type.

Table 2.475. Parameters

pList	A pointer to a linked list onto which the data item is to be appended.
pData	A pointer to a data item to be appended to the list.

Returns: . A pointer to the allocated linked list structure.

OSBOOL rtxSListFind (OSRTSList *pList, void *pData)

This function finds an item in the linked list structure. The data item is passed into the function as a void pointer that can point to an object of any type. If the appropriate node is found in the list this function returns TRUE, otherwise FALSE.

Table 2.476. Parameters

pList	A pointer to a linked list onto which the data item is to be appended.
pData	A pointer to a data item to be appended to the list.

Returns: . TRUE, if the node is found, otherwise FALSE.

void rtxSListRemove (OSRTSList *pList, void *pData)

This function finds an item in the linked list structure and removes it from the list. The data item is passed into the function as a void pointer that can point to an object of any type.

Table 2.477. Parameters

pList	A pointer to a linked list onto which the data item is to be appended.
pData	A pointer to a data item to be appended to the list.

Stack Utility Functions

Detailed Description

This is a simple stack structure with supporting push and pop functions. Different initialization routines are provided to permit different memory management schemes.

Classes

- struct _OSRTStack

Typedefs

- typedef struct _OSRTStack OSRTStack

Functions

- OSRTStack * rtxStackCreate (struct OSCTXT * pctxt)
- void rtxStackInit (struct OSCTXT * pctxt, OSRTStack * pStack)
- void * rtxStackPop (OSRTStack * pStack)
- int rtxStackPush (OSRTStack * pStack, void * pData)
- void * rtxStackPeek (OSRTStack * pStack)

Macros

- #define rtxStackIsEmpty (OSBOOL)((stack).dlist.count == 0)

Function Documentation

OSRTStack* rtxStackCreate (struct OSCTXT *pctxt)

This function creates a new stack structure. It allocates memory for the structure and calls rtxStackInit to initialize the structure.

Table 2.478. Parameters

pctxt	A pointer to the context with which the stack is associated.
-------	--

Returns: . A pointer to an allocated stack structure.

void rtxStackInit (struct OSCTXT *pctxt, OSRTStack *pStack)

This function initializes a stack structure. It sets the number of elements to zero and sets all internal pointer values to NULL.

Table 2.479. Parameters

pctxt	A pointer to the context with which the stack is associated.
pStack	A pointer to a stack structure to be initialized.

void* rtxStackPop (OSRTStack *pStack)

This function pops an item off the stack.

Table 2.480. Parameters

pStack	The pointer to the stack structure from which the value is to be popped. Pointer to the updated stack structure.
--------	--

Returns: . The pointer to the item popped from the stack

int rtxStackPush (OSRTStack *pStack, void *pData)

This function pushes an item onto the stack.

Table 2.481. Parameters

pStack	A pointer to the structure onto which the data item is to be pushed. The pointer updated to the stack structure
pData	A pointer to the data item to be pushed on the stack.

Returns: . Completion status of operation:

- 0 (0) = success,
- negative return value is error.

void* rtxStackPeek (OSRTStack *pStack)

This functions returns the data item on the top of the stack.

Table 2.482. Parameters

pStack	A pointer to the structure onto which the data item is to be pushed. The pointer updated to the stack structure
--------	---

Returns: . Pointer to data item at top of stack or NULL if stack empty.

- 0 (0) = success,
- negative return value is error.

Macro Definition Documentation

#define rtxStackIsEmpty

This macro tests if the stack is empty.

Table 2.483. Parameters

stack	Stack structure variable to be tested.
-------	--

Definition at line 82 of file rtxStack.h

The Documentation for this define was generated from the following file:

- rtxStack.h

Pattern matching functions

Detailed Description

These functions handle pattern matching which is required to to process XML schema pattern constraints.

Functions

- OSBOOL rtxMatchPattern (OSCTXT * pctxt, const OSUTF8CHAR * text, const OSUTF8CHAR * pattern)
- OSBOOL rtxMatchPattern2 (OSCTXT * pctxt, const OSUTF8CHAR * pattern)
- void rtxFreeRegexpCache (OSCTXT * pctxt)

Function Documentation

OSBOOL rtxMatchPattern (OSCTXT *pctxt, const OSUTF8CHAR *text, const OSUTF8CHAR *pattern)

This function compares the given string to the given pattern. It returns true if match, false otherwise.

Table 2.484. Parameters

pctxt	Pointer to context structure.
text	Text to be matched.
pattern	Regular expression.

Returns: . Boolean result.

void rtxFreeRegexpCache (OSCTXT *pctxt)

This function frees the memory associated with the regular expression cache. The regular expression cache is designed to use memory that survives calls to `rtxMemFree` and `rtxMemReset`, therefore it is necessary to call this function to free that memory. (Note that `rtxFreeContext` invokes this.)

Diagnostic trace functions

Detailed Description

These functions add diagnostic tracing to the generated code to assist in finding where a problem might occur. Calls to these macros and functions are added when the `-trace` command-line argument is used. The diagnostic message can be turned on and off at both C compile and run-time. To C compile the diagnostics in, the `_TRACE` macro must be defined (`-D_TRACE`). To turn the diagnostics on at run-time, the `rtxSetDiag` function must be invoked with the `value` argument set to `TRUE`.

Classes

- struct OSRTPrintStream
- struct OSRTStrBuf

Enumerations

- enum OSRTDiagTraceLevel {
 OSRTDiagError,
 OSRTDiagWarning,
 OSRTDiagInfo,
 OSRTDiagDebug
 }

Typedefs

- typedef void(* rtxPrintCallback
- typedef struct OSRTPrintStream OSRTPrintStream

Variables

- OSRTPrintStream g_PrintStream

Functions

- `int rtxSetPrintStream (OSCTXT * pctxt, rtxPrintCallback myCallback, void * pStrmInfo)`
- `int rtxSetGlobalPrintStream (rtxPrintCallback myCallback, void * pStrmInfo)`
- `int rtxPrintToStream (OSCTXT * pctxt, const char * fmtspec, ...)`
- `int rtxDiagToStream (OSCTXT * pctxt, const char * fmtspec, va_list arglist)`

- #define RTHEXDUMPSTRM
- #define RTDIAGSCHARS

Typedef Documentation

typedef void(* rtxPrintCallback) (void *pPrntStrmInfo, const char *fmtspec, va_list arglist)

Callback function definition for print stream.

typedef struct OSRTPrintStream OSRTPrintStream

Structure to hold information about a global PrintStream.

Variable Documentation

OSRTPrintStream g_PrintStream

Global PrintStream

Function Documentation

int rtxSetPrintStream (OSCTXT *pctxt, rtxPrintCallback myCallback, void *pStrmInfo)

This function is for setting the callback function for a PrintStream. Once a callback function is set, then all print and debug output ia sent to the defined callback function.

Table 2.485. Parameters

pctxt	Pointer to a context in which callback print function will be set
myCallback	Pointer to a callback print function.
pStrmInfo	Pointer to user defined PrintInfo structure where users can store information required by the callback function across calls. Ex. An open File handle for callbak function which directs stream to a file.

Returns: . Completion status, 0 on success, negative value on failure

int rtxSetGlobalPrintStream (rtxPrintCallback myCallback, void *pStrmInfo)

This function is for setting the callback function for a PrintStream. This version of the function sets a callback at the global level.

Table 2.486. Parameters

myCallback	Pointer to a callback print function.
pStrmInfo	Pointer to user defined PrintInfo structure where users can store information required by the callback function across calls. Ex. An open File handle for callbak function which directs stream to a file.

Returns: . Completion status, 0 on success, negative value on failure

int rtxPrintToStream (OSCTXT *pctxt, const char *fmtspec,...)

Print-to-stream function which in turn calls the user registered callback function of the context for printing. If no callback function is registered it prints to standard output by default.

Table 2.487. Parameters

pctxt	Pointer to context to be used.
fmtspec	A printf-like format specification string describing the message to be printed (for example, "string %s, ivalue %d\n").
...	A variable list of arguments.

Returns: . Completion status, 0 on success, negative value on failure

int rtxDiagToStream (OSCTXT *pctxt, const char *fmtspec, va_list arglist)

Diagnostics print-to-stream function. This is the same as the `rtxPrintToStream` function except that it checks if diagnostic tracing is enabled before invoking the callback function.

Table 2.488. Parameters

pctxt	Pointer to context to be used.
fmtspec	A printf-like format specification string describing the message to be printed (for example, "string %s, ivalue %d\n").
arglist	A variable list of arguments passed as <code>va_list</code>

Returns: . Completion status, 0 on success, negative value on failure

int rtxPrintStreamRelease (OSCTXT *pctxt)

This function releases the memory held by PrintStream in the context

Table 2.489. Parameters

pctxt	Pointer to a context for which the memory has to be released.
-------	---

Returns: . Completion status, 0 on success, negative value on failure

void rtxPrintStreamToStdoutCB (void *pPrntStrmInfo, const char *fmtspec, va_list arglist)

Standard callback function for use with print-to-stream for writing to stdout.

Table 2.490. Parameters

pPrntStrmInfo	User-defined information for use by the callback function. This is supplied by the user at the time the callback is registered. In this case, no user-defined information is required, so the argument can be set to NULL when the callback is registered.
fmtspec	Format specification of the data to be printed. This is supplied by the print-to-stream utility.
arglist	Variable argument list. This is supplied by the print-to-stream utility.

void rtxPrintStreamToFileCB (void *pPrntStrmInfo, const char *fmtspec, va_list arglist)

Standard callback function for use with print-to-stream for writing to a file.

Table 2.491. Parameters

pPrntStrmInfo	User-defined information for use by the callback function. This is supplied by the user at the time the callback is registered. This parameter should be set to the file pointer (FILE*) to which data is to be written.
fmtspec	Format specification of the data to be printed. This is supplied by the print-to-stream utility.
arglist	Variable argument list. This is supplied by the print-to-stream utility.

void rtxPrintStreamToStringCB (void *pPrntStrmInfo, const char *fmtspec, va_list arglist)

Standard callback function for use with print-to-stream for writing to a string.

Table 2.492. Parameters

pPrntStrmInfo	User-defined information for use by the callback function. This is supplied by the user at the time the callback is registered. This parameter should be set to a pointer to an OSRTStrBuf structure.
---------------	---

fmspec	Format specification of the data to be printed. This is supplied by the print-to-stream utility.
arglist	Variable argument list. This is supplied by the print-to-stream utility.

OSBOOL rtxDiagEnabled (OSCTXT *pctxt)

This function is used to determine if diagnostic tracing is currently enabled for the specified context. It returns true if enabled, false otherwise.

Table 2.493. Parameters

pctxt	Pointer to context structure.
-------	-------------------------------

Returns: . Boolean result.

OSBOOL rtxSetDiag (OSCTXT *pctxt, OSBOOL value)

This function is used to turn diagnostic tracing on or off at run-time on a per-context basis. Code generated using ASN1C or XBinder or a similar code generator must use the -trace command line option to enable diagnostic messages. The generated code must then be C compiled with _TRACE defined for the code to be present.

Table 2.494. Parameters

pctxt	Pointer to context structure.
value	Boolean switch: TRUE turns tracing on, FALSE off.

Returns: . Prior setting of the diagnostic trace switch in the context.

OSBOOL rtxSetGlobalDiag (OSBOOL value)

This function is used to turn diagnostic tracing on or off at run-time on a global basis. It is similar to rtxSetDiag except tracing is enabled within all contexts.

Table 2.495. Parameters

value	Boolean switch: TRUE turns tracing on, FALSE off.
-------	---

Returns: . Prior setting of the diagnostic trace switch in the context.

void rtxDiagPrint (OSCTXT *pctxt, const char *fmspec,...)

This function is used to print a diagnostics message to stdout. Its parameter specification is similar to that of the C runtime printf method. The fmspec argument may contain % style modifiers into which variable arguments are substituted. This function is called in the generated code via the RTDIAG macros to allow diagnostic trace call to easily be compiled out of the object code.

Table 2.496. Parameters

pctxt	Pointer to context structure.
fmtspeg	A printf-like format specification string describing the message to be printed (for example, "string %s, ivalue %d\n"). A special character sequence (~L) may be used at the beginning of the string to select a trace level (L would be replaced with E for Error, W for warning, I for info, or D for debug).
...	Variable list of parameters to be substituted into the format string.

void rtxDiagStream (OSCTXT *pctxt, const char *fmtspeg,...)

This function conditionally outputs diagnostic trace messages to an output stream defined within the context. A code generator embeds calls to this function into the generated source code when the -trace option is specified on the command line (note: it may embed the macro version of these calls - RTDIAGSTREAMx - so that these calls can be compiled out of the final code).

See also: . rtxDiagPrint

void rtxDiagHexDump (OSCTXT *pctxt, const OSOCTET *data, size_t numocts)

This function is used to print a diagnostics hex dump of a section of memory.

Table 2.497. Parameters

pctxt	Pointer to context structure.
data	Start address of memory to dump.
numocts	Number of bytes to dump.

void rtxDiagStreamHexDump (OSCTXT *pctxt, const OSOCTET *data, size_t numocts)

This function is used to print a diagnostics hex dump of a section of memory to a print stream.

Table 2.498. Parameters

pctxt	Pointer to context structure.
data	Start address of memory to dump.
numocts	Number of bytes to dump.

void rtxDiagPrintChars (OSCTXT *pctxt, const char *data, size_t nchars)

This function is used to print a given number of characters to standard output. The buffer containing the characters does not need to be null-terminated.

Table 2.499. Parameters

pctxt	Pointer to context structure.
data	Start address of character string.
nchars	Number of characters to dump (this assumes 1-byte chars).

void rtxDiagStreamPrintChars (OSCTXT *pctxt, const char *data, size_t nchars)

This function is used to print a given number of characters to a print stream. The buffer containing the characters does not need to be null-terminated.

Table 2.500. Parameters

pctxt	Pointer to context structure.
data	Start address of character string.
nchars	Number of characters to dump (this assumes 1-byte chars).

void rtxDiagStreamPrintBits (OSCTXT *pctxt, const char *descr, const OSOCTET *data, size_t bitIndex, size_t nbits)

This function is used to print a given number of bits as '1' or '0' values to a print stream.

Table 2.501. Parameters

pctxt	Pointer to context structure.
descr	Descriptive text to print before bits
data	Start address of binary data.
bitIndex	Zero-based offset to first bit to be printed
nbits	Number of bits to dump

void rtxDiagSetTraceLevel (OSCTXT *pctxt, OSRTDiagTraceLevel level)

This function is used to set the maximum trace level for diagnostic trace messages. Values are ERROR, WARNING, INFO, or DEBUG. The special string start sequence (~L) described in rtxDiagPrint function documentation is used to set a message level to be compared with the trace level.

Table 2.502. Parameters

pctxt	Pointer to context structure.
level	Trace level to be set.

OSBOOL rtxDiagTraceLevelEnabled (OSCTXT *pctx, OSRTDiagTraceLevel level)

This function tests if a given trace level is enabled.

Table 2.503. Parameters

pctx	Pointer to context structure.
level	Trace level to check.

Returns: . True if enabled.

Error Formatting and Print Functions

Detailed Description

Error formatting and print functions allow information about encode/decode errors to be added to a context block structure and then printed when the error is propagated to the top level.

Typedefs

- typedef int(* OSErrCbFunc

Functions

- OSBOOL rtxErrAddCtxtBufParm (OSCTXT * pctx)

Function Documentation

OSBOOL rtxErrAddCtxtBufParm (OSCTXT *pctxt)

This function adds the contents of the context buffer to the error information structure in the context. The buffer contents are assumed to contain only printable characters.

Table 2.504. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddDoubleParm (OSCTXT *pctxt, double errParm)

This function adds a double parameter to an error information structure.

Table 2.505. Parameters

pctxt	A pointer to a context structure.
errParm	The double error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddErrorTableEntry (const char *const *ppStatusText, OSINT32 minErrCode, OSINT32 maxErrCode)

This function adds a set of error codes to the global error table. It is called within context initialization functions to add errors defined for a specific domain (for example, ASN.1 encoding/decoding) to be added to the global list of errors.

Table 2.506. Parameters

ppStatusText	Pointer to table of error status text messages.
minErrCode	Minimum error status code.
maxErrCode	Maximum error status code.

Returns: . The status of the operation (TRUE if entry successfully added to table).

OSBOOL rtxErrAddElemNameParm (OSCTXT *pctxt)

This function adds an element name parameter to the context error information structure. The element name is obtained from the context element name stack. If the stack is empty, a question mark character (?) is inserted for the name.

Table 2.507. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddIntParm (OSCTXT *pctxt, int errParm)

This function adds an integer parameter to an error information structure. Parameter substitution is done in much the same way as it is done in C printf statements. The base error message specification that goes along with a particular status code may have variable fields built in using " modifiers. These would be replaced with actual parameter data.

Table 2.508. Parameters

pctxt	A pointer to a context structure.
errParm	The integer error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddInt64Parm (OSCTXT *pctxt, OSINT64 errParm)

This function adds a 64-bit integer parameter to an error information structure. Parameter substitution is done in much the same way as it is done in C printf statements. The base error message specification that goes along with a particular status code may have variable fields built in using " modifiers. These would be replaced with actual parameter data.

Table 2.509. Parameters

pctxt	A pointer to a context structure.
errParm	The 64-bit integer error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddSizeParm (OSCTXT *pctxt, OSSIZE errParm)

This function adds a size-typed parameter to an error information structure. Parameter substitution is done in much the same way as it is done in C printf statements. The base error message specification that goes along with a particular status code may have variable fields built in using " modifiers. These would be replaced with actual parameter data.

Table 2.510. Parameters

pctxt	A pointer to a context structure.
errParm	The integer error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddStrParm (OSCTXT *pctxt, const char *pErrParm)

This function adds a character string parameter to an error information structure.

Table 2.511. Parameters

pctxt	A pointer to a context structure.
pErrParm	The character string error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddStrnParm (OSCTXT *pctxt, const char *pErrParm, OSSIZE nchars)

This function adds a given number of characters from a character string parameter to an error information structure.

Table 2.512. Parameters

pctxt	A pointer to a context structure.
pErrParm	The character string error parameter.
nchars	Number of characters to add from pErrParm.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddUIntParm (OSCTXT *pctxt, unsigned int errParm)

This function adds an unsigned integer parameter to an error information structure.

Table 2.513. Parameters

pctxt	A pointer to a context structure.
errParm	The unsigned integer error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

OSBOOL rtxErrAddUInt64Parm (OSCTXT *pctxt, OSUINT64 errParm)

This function adds an unsigned 64-bit integer parameter to an error information structure.

Table 2.514. Parameters

pctxt	A pointer to a context structure.
errParm	The unsigned 64-bit integer error parameter.

Returns: . The status of the operation (TRUE if the parameter was successfully added).

void rtxErrAssertionFailed (const char *conditionText, int lineNo, const char *fileName)

This function is used to record an assertion failure. It is used in conjunction with the OTRTASSERT macro. It outputs information on the condition to `stderr` and then calls `exit` to terminate the program.

Table 2.515. Parameters

conditionText	The condition that failed (for example, ptr != NULL)
lineNo	Line number in the program of the failure.
fileName	Name of the C source file in which the assertion failure occurred.

const char* rtxErrFmtMsg (OSRTErrInfo *pErrInfo, char *bufp, OSSIZE bufsiz)

This function formats a given error structure from the context into a finished status message including substituted parameters.

Table 2.516. Parameters

pErrInfo	Pointer to error information structure.
bufp	Pointer to a destination buffer to receive text.
bufsiz	Size of the buffer.

Returns: . Pointer to the buffer (bufp).

void rtxErrFreeParms (OSCTXT *pctxt)

This function is used to free dynamic memory that was used in the recording of error parameters. After an error is logged, this function should be called to prevent memory leaks.

Table 2.517. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

char* rtxErrGetText (OSCTXT *pctxt, char *pBuf, OSSIZE *pBufSize)

This function returns error text in a memory buffer. If buffer pointer and buffer size are specified in parameters (not NULL) then error text will be copied in the passed buffer. Otherwise, this function allocates memory using the 'rtxMemAlloc' function. This memory is automatically freed at the time the 'rtxMemFree' or 'rtxFreeContext' functions are called. The calling function may free the memory by using 'rtxMemFreePtr' function.

Table 2.518. Parameters

pctxt	A pointer to a context structure.
pBuf	A pointer to a destination buffer to obtain the error text. If NULL, dynamic buffer will be allocated.
pBufSize	A pointer to buffer size. If pBuf is NULL and this parameter is not, it will receive the size of allocated dynamic buffer. If pBuf is not null, this is expected to be set and hold the size of the buffer.

Returns: . A pointer to a buffer with error text. If pBuf is not NULL, the return pointer will be equal to it. Otherwise, returns newly allocated buffer with error text. NULL, if error occurred.

char* rtxErrGetTextBuf (OSCTXT *pctxt, char *pbuf, OSSIZE bufsiz)

This function returns error text in the given fixed-size memory buffer. If the text will not fit in the buffer, it is truncated.

Table 2.519. Parameters

pctxt	A pointer to a context structure.
pbuf	Pointer to a destination buffer to receive text.
bufsiz	Size of the buffer.

Returns: . Pointer to the buffer (pbuf).

char* rtxErrMsgText (OSCTXT *pctxt)

This function returns error message text in a memory buffer. It only returns the formatted error message, not the error status nor stack trace information. Memory is dynamically allocated using the rtxMemAlloc function. It should be freed using rtxMemFreePtr or it will be freed when the context is freed.

Table 2.520. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . A pointer to a buffer with error text. Dynamic memory will be allocated for this buffer using rtxMemAlloc. It should be freed using rtxMemFreePtr.

char* rtxErrGetMsgTextBuf (OSCTXT *pctxt, char *pbuf, OSSIZE bufsiz)

This function returns error message text in a static memory buffer. It only returns the formatted error message, not the error status nor stack trace information. If the formatted text will not fit in the buffer, it is truncated.

Table 2.521. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

pbuf	Pointer to a destination buffer to receive text.
bufsiz	Size of the buffer.

Returns: . Pointer to the buffer (pbuf).

OSRTErrInfo* rtxErrNewNode (OSCTXT *pctxt)

This function creates a new empty error record for the passed context. `rtxErrSetData` function call with `bAllocNew = FALSE` should be used to set the data for this node. The new record will have `fatal == TRUE`.

Table 2.522. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . A pointer to a newly allocated error record; NULL, if error occurred.

void rtxErrInit (OSVOIDARG)

This function is a one-time initialization function that must be called before any other error processing functions can be called. It adds the common error status text codes to the global error table.

int rtxErrReset (OSCTXT *pctxt)

This function is used to reset the error state recorded in the context to successful. It is used in the generated code in places where automatic error correction can be done.

Table 2.523. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

int rtxErrResetErrInfo (OSCTXT *pctxt)

This function is used to reset the error state recorded in the context to successful. It is used in the generated code in places where automatic error correction can be done. This version differs from `rtxErrReset` in that it only resets error information within the context and not the element name and container stacks.

Table 2.524. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

void rtxErrLogUsingCB (OSCTXT *pctxt, OSErrCbFunc cb, void *cbArg_p)

This function allows error information to be logged using a user-defined callback routine. The callback routine is invoked IMMEDIATELY; it is not a "callback" in the ordinary use of that word. The callback routine is invoked with error information in the context allowing the user to do application-specific handling (for example, it can be written

to an error log or a Window display). After invoking the callback, this method will invoke `rtxErrFreeParms` to free memory associated with the error information.

The prototype of the callback function to be passed is as follows:

```
int cb (const char* ptext, void* cbArg_p);
```

where *ptext* is a pointer to the formatted error text string and *cbArg_p* is a pointer to a user-defined callback argument.

Table 2.525. Parameters

pctxt	A pointer to a context structure.
cb	Callback function pointer.
cbArg_p	Pointer to a user-defined argument that is passed to the callback function.

void rtxErrPrint (OSCTXT *pctxt)

This function is used to print the error information stored in the context to the standard output device. Parameter substitution is done so that recorded parameters are added to the output message text.

Table 2.526. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

void rtxErrPrintElement (OSRTErrInfo *pErrInfo)

This function is used to print the error information stored in the error information element to the standard output device. Parameter substitution is done so that recorded parameters are added to the output message text.

Table 2.527. Parameters

pErrInfo	A pointer to an error information element.
----------	--

int rtxErrSetData (OSCTXT *pctxt, int status, const char *module, int lineno)

This function is used to record an error in the context structure. It is typically called via the `LOG_RTERR` macro in the generated code to trap error conditions. If no error has been logged, a new log entry is created. The new entry will have `fatal = TRUE`.

Table 2.528. Parameters

pctxt	A pointer to a context structure.
status	The error status code from <code>rtxErrCodes.h</code>

module	The C source file in which the error occurred.
lineno	The line number within the source file of the error.

Returns: . The status code that was passed in.

int rtxErrSetNewData (OSCTXT *pctxt, int status, const char *module, int lineno)

This function is used to record an error in the context structure. It is typically called via the LOG_RTERRNEW macro in the generated code to trap error conditions. It always allocates new error record with fatal = TRUE.

Table 2.529. Parameters

pctxt	A pointer to a context structure.
status	The error status code from rtxErrCodes.h
module	The C source file in which the error occurred.
lineno	The line number within the source file of the error.

Returns: . The status code that was passed in.

void rtxErrSetNonFatal (OSCTXT *pctxt)

This marks the last error recorded in the context as non-fatal. Non-fatal errors are ignored by rtxErrGetStatus but are otherwise treated the same as any other error. This is useful when recording, for example, canonical violations, which are errors but which don't force an operation to abort.

int rtxErrGetFirstError (const OSCTXT *pctxt)

This function returns the error code, stored in the first error record.

Table 2.530. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . The first status code; zero if no error records exist.

int rtxErrGetLastError (const OSCTXT *pctxt)

This function returns the error code, stored in the last error record.

Table 2.531. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . The last status code; zero if no error records exist.

OSSIZE rtxErrGetErrorCnt (const OSCTXT *pctxt)

This function returns the total number of error records, including non-fatal errors.

Table 2.532. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . The total number of error records in the context.

int rtxErrGetStatus (const OSCTXT *pctxt)

This function returns the status value from the context. It examines the error list to see how many fatal errors were logged. If none, OK (zero) is returned; if one, then the status value in that single error record is returned; if more than one, the special code RTERR_MULTIPLE is returned to indicate that multiple errors occurred. Non-fatal errors are entirely ignored.

Table 2.533. Parameters

pctxt	A pointer to a context structure.
-------	-----------------------------------

Returns: . Status code corresponding to errors in the context.

int rtxErrResetLastErrors (OSCTXT *pctxt, OSSIZE errorsToReset)

This function resets last 'errorsToReset' errors in the context.

Table 2.534. Parameters

pctxt	A pointer to a context structure.
errorsToReset	A number of errors to reset, starting from the last record.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxErrCopy (OSCTXT *pDestCtxt, const OSCTXT *pSrcCtxt)

This function copies error information from one context into another. Any error information that may have existed in the destination context prior to the operation is lost.

Table 2.535. Parameters

pDestCtxt	Pointer to destination context structure to receive the copied error information.
-----------	---

pSrcCtxt	Pointer to source context from which error information will be copied.
----------	--

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxErrAppend (OSCTXT *pDestCtxt, const OSCTXT *pSrcCtxt)

This function appends error information from one context into another. Error information is added to what previously existed in the destination context.

Table 2.536. Parameters

pDestCtxt	Pointer to destination context structure to receive the copied error information.
pSrcCtxt	Pointer to source context from which error information will be copied.

Returns: . Completion status of operation:

- 0(RT_OK) = success,
- negative return value is error

int rtxErrInvUIntOpt (OSCTXT *pctxt, OSUINT32 ident)

This function create an 'invalid option' error (RTERR_INVOPT) in the context using an unsigned integer parameter.

Table 2.537. Parameters

pctxt	Pointer to context structure.
ident	Identifier which was found to be invalid.

Macro Definition Documentation

#define LOG_RTERR

This macro is used to log a run-time error in the context. It calls the `rtxErrSetData` function to set the status and error parameters. The C built-in `FILE` and `LINE` macros are used to record the position in the source file of the error.

Table 2.538. Parameters

pctxt	A pointer to a context structure.
stat	Error status value from <code>rtxErrCodes.h</code>

Definition at line 79 of file `rtxError.h`

The Documentation for this define was generated from the following file:

- rtxError.h

#define OSRTASSERT

This macro is used to check an assertion. This is a condition that is expected to be true. The `rtxErrAssertionFailed` function is called if the condition is not true. The C built-in **FILE** and **LINE** macros are used to record the position in the source file of the failure.

Table 2.539. Parameters

condition	Condition to check (for example, "(ptr != NULL)")
-----------	---

Definition at line 102 of file rtxError.h

The Documentation for this define was generated from the following file:

- rtxError.h

#define OSRTCHECKPARAM

This macro check a condition but takes no action. Its main use is to supress VC++ level 4 "argument not used" warnings.

Table 2.540. Parameters

condition	Condition to check (for example, "(ptr != NULL)")
-----------	---

Definition at line 111 of file rtxError.h

The Documentation for this define was generated from the following file:

- rtxError.h

#define LOG_RTERR_AND_FREE_MEM

This logs an error to a global context and frees a memory pointer allocated for encoding or decoding.

Table 2.541. Parameters

ctxt_p	A pointer to the main context data structure.
stat	The error status.
mem_p	The memory pointer allocated for encoding/decoding.

Returns: . The result of logging the error to the global context.

Definition at line 145 of file rtxError.h

The Documentation for this define was generated from the following file:

- rtxError.h

Run-time error status codes.

Detailed Description

This is a list of status codes that can be returned by the common run-time functions and generated code. In many cases, additional information and parameters for the different errors are stored in the context structure at the time the error is raised. This additional information can be output using the `rtxErrPrint` or `rtxErrLogUsingCB` run-time functions.

Macro Definition Documentation

#define RT_OK

Normal completion status.

Definition at line 46 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RT_OK_FRAG

Message fragment return status. This is returned when a part of a message is successfully decoded. The application should continue to invoke the decode function until a zero status is returned.

Definition at line 53 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_BUFOVFLW

Encode buffer overflow. This status code is returned when encoding into a static buffer and there is no space left for the item currently being encoded.

Definition at line 60 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_ENDOFBUF

Unexpected end-of-buffer. This status code is returned when decoding and the decoder expects more data to be available but instead runs into the end of the decode buffer.

Definition at line 67 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_IDNOTFOU

Expected identifier not found. This status is returned when the decoder is expecting a certain element to be present at the current position and instead something different is encountered. An example is decoding a sequence container type in which the declared elements are expected to be in the given order. If an element is encountered that is not the one expected, this error is raised.

Definition at line 77 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVENUM

Invalid enumerated identifier. This status is returned when an enumerated value is being encoded or decoded and the given value is not in the set of values defined in the enumeration facet.

Definition at line 84 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SETDUPL

Duplicate element in set. This status code is returned when decoding an ASN.1 SET or XSD xsd:all construct. It is raised if a given element defined in the content model group occurs multiple times in the instance being decoded.

Definition at line 92 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SETMISRQ

Missing required element in set. This status code is returned when decoding an ASN.1 SET or XSD xsd:all construct and all required elements in the content model group are not found to be present in the instance being decoded.

Definition at line 100 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOTINSET

Element not in set. This status code is returned when encoding or decoding an ASN.1 SET or XSD xsd:all construct. When encoding, it occurs when a value in the generated `_order` member variable is outside the range of indexes of items in the content model group. It occurs on the decode side when an element is received that is not defined in the content model group.

Definition at line 110 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SEQOVFLW

Sequence overflow. This status code is returned when decoding a repeating element (ASN.1 SEQUENCE OF or XSD element with `min/maxOccurs > 1`) and more instances of the element are received than were defined in the constraint.

Definition at line 118 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVOPT

Invalid option in choice. This status code is returned when encoding or decoding an ASN.1 CHOICE or XSD xsd:choice construct. When encoding, it occurs when a value in the generated 't' member variable is outside the range of indexes of items in the content model group. It occurs on the decode side when an element is received that is not defined in the content model group.

Definition at line 128 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOMEM

No dynamic memory available. This status code is returned when a dynamic memory allocation request is made and an insufficient amount of memory is available to satisfy the request.

Definition at line 135 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVHEXS

Invalid hexadecimal string. This status code is returned when decoding a hexadecimal string value and a character is encountered in the string that is not in the valid hexadecimal character set ([0-9A-Fa-f] or whitespace).

Definition at line 143 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVREAL

Invalid real number value. This status code is returned when decoding a numeric floating-point value and an invalid character is received (i.e. not numeric, decimal point, plus or minus sign, or exponent character).

Definition at line 151 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_STROVFLW

String overflow. This status code is returned when a fixed-sized field is being decoded as specified by a size constraint and the item contains more characters or bytes than this amount. It can occur when a run-time function is called with a fixed-sized static buffer and whatever operation is being done causes the bounds of this buffer to be exceeded.

Definition at line 161 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_BADVALUE

Bad value. This status code is returned anywhere where an API is expecting a value to be within a certain range and it not within this range. An example is the encoding or decoding date values when the month or day value is not within the legal range (1-12 for month and 1 to whatever the max days is for a given month).

Definition at line 170 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_TOODEEP

Nesting level too deep. This status code is returned when a preconfigured maximum nesting level for elements within a content model group is exceeded.

Definition at line 177 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_CONSVIO

Constraint violation. This status code is returned when constraints defined the schema are violated. These include XSD facets such as min/maxOccurs, min/maxLength, patterns, etc.. Also ASN.1 value range, size, and permitted alphabet constraints.

Definition at line 185 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_ENDOFFILE

Unexpected end-of-file error. This status code is returned when an unexpected end-of-file condition is detected on decode. It is similar to the ENDOFBUF error code described above except that in this case, decoding is being done from a file stream instead of from a memory buffer.

Definition at line 193 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVUTF8

Invalid UTF-8 character encoding. This status code is returned by the decoder when an invalid sequence of bytes is detected in a UTF-8 character string.

Definition at line 200 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_OUTOFBND

Array index out-of-bounds. This status code is returned when an attempt is made to add something to an array and the given index is outside the defined bounds of the array.

Definition at line 207 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVPARAM

Invalid parameter passed to a function or method. This status code is returned by a function or method when it does an initial check on the values of parameters passed in. If a parameter is found to not have a value in the expected range, this error code is returned.

Definition at line 215 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVFORMAT

Invalid value format. This status code is returned when a value is received or passed into a function that is not in the expected format. For example, the time string parsing function expects a string in the form "nn:nn:nn" where n's are numbers. If not in this format, this error code is returned.

Definition at line 224 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOTINIT

Context not initialized. This status code is returned when the run-time context structure (OSCTXT) is attempted to be used without having been initialized. This can occur if rtxInitContext is not invoked to initialize a context variable before use in any other API call. It can also occur if there is a license violation (for example, evaluation license expired).

Definition at line 234 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_TOOBIG

Value will not fit in target variable. This status is returned by the decoder when a target variable is not large enough to hold a decoded value. A typical case is an integer value that is too large to fit in the standard C integer type (typically a 32-bit value) on a given platform. If this occurs, it is usually necessary to use a configuration file setting to force the compiler to use a different data type for the item. For example, for integer, the <isBigInteger/> setting can be used to force use of a big integer type.

Definition at line 246 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVCHAR

Invalid character. This status code is returned when a character is encountered that is not valid for a given data type. For example, if an integer value is being decoded and a non-numeric character is encountered, this error will be raised.

Definition at line 254 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_XMLSTATE

XML state error. This status code is returned when the XML parser is not in the correct state to do a certain operation.

Definition at line 260 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_XMLPARSE

XML parser error. This status code is returned when the underlying XML parser application (by default, this is Expat) returns an error code. The parser error code or text is returned as a parameter in the errInfo structure within the context structure.

Definition at line 268 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SEQORDER

Sequence order error. This status code is returned when decoding an ASN.1 SEQUENCE or XSD xsd:sequence construct. It is raised if the elements were received in an order different than that specified in the content model group definition.

Definition at line 276 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_FILNOTFOU

File not found. This status code is returned if an attempt is made to open a file input stream for decoding and the given file does not exist.

Definition at line 283 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_READERR

Read error. This status code is returned if a read I/O error is encountered when reading from an input stream associated with a physical device such as a file or socket.

Definition at line 290 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_WRITEERR

Write error. This status code is returned if a write I/O error is encountered when attempting to output data to an output stream associated with a physical device such as a file or socket.

Definition at line 297 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVBASE64

Invalid Base64 encoding. This status code is returned when an error is detected in decoding base64 data.

Definition at line 303 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVSOCKET

Invalid socket. This status code is returned when an attempt is made to read or write from a socket and the given socket handle is invalid. This may be the result of not having established a proper connection before trying to use the socket handle variable.

Definition at line 311 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVATTR

Invalid attribute. This status code is returned by the decoder when an attribute is encountered in an XML instance that was not defined in the XML schema.

Definition at line 322 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_REGEX

Invalid regular expression. This status code is returned when a syntax error is detected in a regular expression value. Details of the syntax error can be obtained by invoking rtxErrPrint to print the details of the error contained within the context variable.

Definition at line 331 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_PATMATCH

Pattern match error. This status code is returned by the decoder when a value in an XML instance does not match the pattern facet defined in the XML schema. It can also be returned by numeric encode functions that cannot format a numeric value to match the pattern specified for that value.

Definition at line 340 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_ATTRMISRQ

Missing required attribute. This status code is returned by the decoder when an XML instance is missing a required attribute value as defined in the XML schema.

Definition at line 347 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_HOSTNOTFOU

Host name could not be resolved. This status code is returned from run-time socket functions when they are unable to connect to a given host computer.

Definition at line 354 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_HTTPERR

HTTP protocol error. This status code is returned by functions doing HTTP protocol operations such as SOAP functions. It is returned when a protocol error is detected. Details on the specific error can be obtained by calling rtxErrPrint.

Definition at line 362 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SOAPERR

SOAP error. This status code when an error is detected when trying to execute a SOAP operation.

Definition at line 368 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_EXPIRED

Evaluation license expired. This error is returned from evaluation versions of the run-time library when the hard-coded evaluation period is expired.

Definition at line 375 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_UNEXPELEM

Unexpected element encountered. This status code is returned when an element is encountered in a position where something else (for example, an attribute) was expected.

Definition at line 382 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVOCUR

Invalid number of occurrences. This status code is returned by the decoder when an XML instance contains a number of occurrences of a repeating element that is outside the bounds (minOccurs/maxOccurs) defined for the element in the XML schema.

Definition at line 390 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVMSGBUF

Invalid message buffer has been passed to decode or validate method. This status code is returned by decode or validate method when the used message buffer instance has type different from OSMessagesBufferIF::XMLDecode.

Definition at line 398 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_DECELEMFAIL

Element decode failed. This status code and parameters are added to the failure status by the decoder to allow the specific element on which a decode error was detected to be identified.

Definition at line 405 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_DECATTRFAIL

Attribute decode failed. This status code and parameters are added to the failure status by the decoder to allow the specific attribute on which a decode error was detected to be identified.

Definition at line 412 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_STRMINUSE

Stream in-use. This status code is returned by stream functions when an attempt is made to initialize a stream or create a reader or writer when an existing stream is open in the context. The existing stream must first be closed before initializaing a stream for a new operation.

Definition at line 421 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NULLPTR

Null pointer. This status code is returned when a null pointer is encountered in a place where it is expected that the pointer value is to be set.

Definition at line 428 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_FAILED

General failure. Low level call returned error.

Definition at line 433 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_ATTRFIXEDVAL

Attribute fixed value mismatch. The attribute contained a value that was different than the fixed value defined in the schema for the attribute.

Definition at line 444 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_MULTIPLE

Multiple errors occurred during an encode or decode operation. See the error list within the context structure for a full list of all errors.

Definition at line 454 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOTYPEINFO

This error is returned when decoding a derived type definition and no information exists as to what type of data is in the element content. When decoding XML, this normally means that an xsi:type attribute was not found identifying the type of content.

Definition at line 465 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_ADDRINUSE

Address already in use. This status code is returned when an attempt is made to bind a socket to an address that is already in use.

Definition at line 471 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_CONNRESET

Remote connection was reset. This status code is returned when the connection is reset by the remote host (via explicit command or a crash).

Definition at line 477 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_UNREACHABLE

Network failure. This status code is returned when the network or host is down or otherwise unreachable.

Definition at line 483 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOCONN

Not connected. This status code is returned when an operation is issued on an unconnected socket.

Definition at line 489 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_CONNREFUSED

Connection refused. This status code is returned when an attempt to communicate on an open socket is refused by the host.

Definition at line 495 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVSOCKOPT

Invalid option. This status code is returned when an invalid option is passed to socket.

Definition at line 501 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_SOAPFAULT

This error is returned when decoded SOAP envelope is fault message

Definition at line 509 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_MARKNOTSUP

This error is returned when an attempt is made to mark a stream position on a stream type that does not support it.

Definition at line 518 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOTSUPP

Feature is not supported. This status code is returned when a feature that is currently not supported is encountered. Support may be added in a future release.

Definition at line 528 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_UNBAL

Unbalanced structure. This error code is returned when parsing formatted text such as XML or JSON and a block is not properly terminated. For JSON, this occurs when a '{' or '[' character does not a corresponding '}' or ']' respectively. For XML, it occurs when an open element does not have a corresponding end element.

Definition at line 537 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_EXPNAME

Expected name. This error code is returned when parsing a name/value pair and the name part is expected, but instead a value is encountered.

Definition at line 543 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_UNICODE

Invalid Unicode sequence. The sequence of characters received did not comprise a valid unicode character.

Definition at line 549 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVBOOL

Invalid boolean keyword. This error code is returned when an invalid boolean keyword in the format of the language being parsed is encountered. For example, 'true' or 'false' in all lowercase letters may be all that is acceptable.

Definition at line 557 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVNULL

Invalid null keyword. This error code is returned when an invalid null keyword in the format of the language being parsed is encountered. For example, 'null' in all lowercase letters may be all that is acceptable.

Definition at line 564 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVLEN

Invalid length. This error code is returned when a length value is parsed that is not consistent with other lengths in a message. This typically happens when an inner length within a constructed type is larger than the outer length value.

Definition at line 572 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_UNKNOWNIE

Unknown information element. This error code is returned when an unknown information element or extension is received and the protocol specification indicates the element must be understood.

Definition at line 579 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOTALIGNED

Not aligned error. This is returned when an element is expected to start on a byte-aligned boundary and is found not to start on an unaligned boundary.

Definition at line 586 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_EXTRDATA

Extraneous data. This error is returned when after decoding is complete, additional undecoded data is still present in the message buffer.

Definition at line 592 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVMAC

Invalid Message Authentication Code. This error is returned when a given message's MAC is not the expected value.

Definition at line 598 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOSECPARAMS

No security parameters provided. This error is returned when a NAS message with either integrity protection or ciphering (or both) is received and the required security parameters needed to decrypt it or validate it have not been provided.

Definition at line 606 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_COPYFAIL

Copy failed. This occurs when generated copy functions are unable to complete a copy operation due to a runtime library failure.

Definition at line 612 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_PARSEFAIL

Parse failed. This error is raised when an application receives a text or binary message it is unable to parse.

Definition at line 618 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_VALCMPERR

Value comparison error. This error is raised when a comparison operation is done on two values and they are not equal.

Definition at line 624 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_BUFCMPERR

Buffer comparison error. This error is raised when a comparison operation is done on two buffers and they are not equal.

Definition at line 630 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_INVBITS

Invalid bit string error. This error is raised when a bit string is decoded that contains bits that have not been set to zero.

Definition at line 636 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_RLM

RLM error encountered.

Definition at line 641 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NOCODEC

No codec. This error is returned when the user has configured ASN1C to not generate a decoder for a type, and then that type appears in an encoding.

Definition at line 647 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_WOULDBLOCK

A non-blocking socket could not return any data without blocking.

Definition at line 652 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

#define RTERR_NODATA

CDR or message file contains no data records.

Definition at line 657 of file rtxErrCodes.h

The Documentation for this define was generated from the following file:

- rtxErrCodes.h

Chapter 3. Class Documentation

`_OSRTBufLocDescr` struct Reference

```
#include <rtxBuffer.h>
```

Public Attributes

- `OSSIZE` `numocts`
- `OSSIZE` `offset`

Detailed Description

Buffer location descriptor

Definition at line 50 of file `rtxBuffer.h`

The Documentation for this struct was generated from the following file:

- `rtxBuffer.h`

`_OSRTSList` struct Reference

```
#include <rtxSList.h>
```

Public Attributes

- `OSSIZE` `count`
- `OSRTSListNode` * `head`
- `OSRTSListNode` * `tail`
- `struct OSCTXT` * `pctxt`

Detailed Description

This is the main list structure. It contains a count of the number of elements in the list and pointers to the list head and tail elements.

Definition at line 68 of file `rtxSList.h`

The Documentation for this struct was generated from the following file:

- `rtxSList.h`

Member Data Documentation

`OSSIZE` `_OSRTSList::count`

Count of items in the list.

Definition at line 69 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

OSRTSListNode* _OSRTSList::head

Pointer to first entry in list.

Definition at line 70 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

OSRTSListNode* _OSRTSList::tail

Pointer to last entry in list.

Definition at line 71 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

_OSRTSListNode struct Reference

```
#include <rtxSList.h>
```

Public Attributes

- void * data
- struct _OSRTSListNode * next

Detailed Description

This structure is used to hold a single data item within the list. It contains a void pointer to point at any type of data item and forward pointer to the next entry in the list.

Definition at line 55 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

Member Data Documentation

void* _OSRTSListNode::data

Pointer to list data item.

Definition at line 56 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

struct `_OSRTSListNode* _OSRTSListNode::next`

Pointer to next node in list.

Definition at line 57 of file rtxSList.h

The Documentation for this struct was generated from the following file:

- rtxSList.h

`_OSRTStack` struct Reference

```
#include <rtxStack.h>
```

Public Attributes

- struct OSCTXT * pctxt
- OSRTDList dlist

Detailed Description

This is the main stack structure. It uses a linked list structure.

Definition at line 48 of file rtxStack.h

The Documentation for this struct was generated from the following file:

- rtxStack.h

Asn116BitCharSet struct Reference

```
#include <asn1type.h>
```

Public Attributes

- Asn116BitCharString charSet
- OSUINT16 firstChar
- OSUINT16 lastChar
- unsigned unalignedBits
- unsigned alignedBits

Detailed Description

Describes an ASN.1 character set whose characters are 16-bits wide instead of 8-bits wide.

Definition at line 1069 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

Asn116BitCharString Asn116BitCharSet::charSet

A character string describing the whole character set.

Definition at line 1071 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSUINT16 Asn116BitCharSet::firstChar

16-bit integers describing the first and last characters in the set.

Definition at line 1074 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn116BitCharSet::unalignedBits

The number of bits required by this set in unaligned applications.

Definition at line 1077 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn116BitCharSet::alignedBits

The number of bits required by this set in aligned applications.

Definition at line 1080 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Asn116BitCharString struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSSIZE nchars

- OSUNICHAR * data

Detailed Description

A structure that holds a 16-bit ASN.1 character string. This contains the number of characters and a pointer to 16-bit characters that hold the string data.

Definition at line 979 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Asn132BitCharSet struct Reference

```
#include <asn1type.h>
```

Public Attributes

- Asn132BitCharString charSet
- OSUINT32 firstChar
- OSUINT32 lastChar
- unsigned unalignedBits
- unsigned alignedBits

Detailed Description

Describes an ASN.1 character set whose characters are 32-bits wide instead of 8-bits wide.

Definition at line 1087 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

Asn132BitCharString Asn132BitCharSet::charSet

A character string describing the whole character set.

Definition at line 1089 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSUINT32 Asn132BitCharSet::firstChar

32-bit integers describing the first and last characters in the set.

Definition at line 1092 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn132BitCharSet::unalignedBits

The number of bits required by this set in unaligned applications.

Definition at line 1095 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn132BitCharSet::alignedBits

The number of bits required by this set in aligned applications.

Definition at line 1098 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Asn132BitCharString struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSSIZE nchars
- OS32BITCHAR * data

Detailed Description

A structure that holds a 32-bit ASN.1 character string. This contains the number of characters and a pointer to 32-bit characters that hold the string data.

Definition at line 991 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1BigInt struct Reference

```
#include <asn1type.h>
```

Public Attributes

- size_t numocts

- OSOCTET * mag
- int sign
- size_t allocated
- OSBOOL dynamic

Detailed Description

A structure used to define an ASN.1 big integer. This structure is rarely, if ever, used by client code, and will instead be used by generated code to facilitate encoding and decoding integer values that cannot fit in normal C/C++ integer types.

Definition at line 1396 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

size_t ASN1BigInt::numocts

The number of octets used in the magnitude.

Definition at line 1398 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSOCTET* ASN1BigInt::mag

The magnitude value.

Definition at line 1401 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

int ASN1BigInt::sign

The sign: either -1, 0, or 1.

Definition at line 1404 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

size_t ASN1BigInt::allocated

The number of octets allocated for the magnitude.

Definition at line 1407 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSBOOL ASN1BigInt::dynamic

A flag that tells whether the buffer is dynamically allocated.

Definition at line 1410 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1BitStr32 struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 numbits
- OSOCTET data[4]

Detailed Description

fixed-size bit string that can hold up to 32 bits

Definition at line 471 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1CCB struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSOCTET * ptr
- long len
- int seqx
- OSUINT16 mask[ASN1_K_CCBMaskSize]
- OSSIZE bytes
- int stat

Detailed Description

The ASN.1 Context Control Block.

This structure is used to help facilitate decoding in SEQUENCE and SET structures. It is rarely (if ever) used directly by client code, and will instead be used in generated code.

Definition at line 1429 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

OSOCKET* ASN1CCB::ptr

The constructor pointer.

Definition at line 1431 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

long ASN1CCB::len

The constructor length.

Definition at line 1434 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

int ASN1CCB::seqx

The sequence element index.

Definition at line 1437 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSUINT16 ASN1CCB::mask[ASN1_K_CCBMaskSize]

The set mask value.

Definition at line 1440 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSSIZE ASN1CCB::bytes

The bytes processed by the block, used for streaming.

Definition at line 1443 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

int ASN1CCB::stat

The status, as returned by BS_CHKEND.

Definition at line 1446 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Asn1CharArray struct Reference

```
#include <asn1type.h>
```

Public Attributes

- int nchars
- char data[255]

Detailed Description

A generic character array. The array data holds up to 255 characters, with the actual number of characters being provided by the nchars member.

Definition at line 1020 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Asn1CharSet struct Reference

```
#include <asn1type.h>
```

Public Attributes

- Asn1CharArray charSet
- const char * canonicalSet
- int canonicalSetSize

- unsigned canonicalSetBits
- unsigned charSetUnalignedBits
- unsigned charSetAlignedBits

Detailed Description

Describes an ASN.1 character set, use primarily for PER encodings whose alphabet constraints can be used to encode more compact representations of their strings.

Definition at line 1030 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

Asn1CharArray Asn1CharSet::charSet

The array of characters that comprise this particular character set; at most this takes up 255 characters.

Definition at line 1035 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

const char* Asn1CharSet::canonicalSet

A character string describing the canonical set of characters.

Definition at line 1040 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

int Asn1CharSet::canonicalSetSize

The size of the canonical character set.

Definition at line 1045 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn1CharSet::canonicalSetBits

The number of bits taken up by the canonical set.

Definition at line 1050 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn1CharSet::charSetUnalignedBits

The number of bits required in unaligned applications for this character set.

Definition at line 1056 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

unsigned Asn1CharSet::charSetAlignedBits

The number of bits required in aligned applications for this character set.

Definition at line 1062 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1DateTime struct Reference

Public Attributes

- OSINT32 century
- OSINT32 year
- OSUINT8 month
- OSUINT8 week
- OSUINT8 day
- OSUINT8 hour
- OSUINT8 min
- OSUINT8 sec
- OSUINT8 fracDigits
- OSUINT32 fracValue
- OSINT8 timezoneDiffHours
- OSUINT8 timezoneDiffMins

ASN1Duration struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 years
- OSUINT32 months
- OSUINT32 weeks
- OSUINT32 days
- OSUINT32 hours
- OSUINT32 mins
- OSUINT32 secs
- OSUINT8 fracDigits
- OSUINT32 fracValue
- OSUINT8 precision

Detailed Description

Represents a duration of time. Durations are supposed to have weeks only, or a combination of years, months, ..., seconds. Durations of different precision are considered distinct values, even if their components are equal. "PT6H" and "PT6H0S" are considered distinct values and have a distinct ASN1Duration representations. "PODT6H" and "PT6H" are considered equal and have the same ASN1Duration representation.

Definition at line 609 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1DynBitStr struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 numbits
- const OSOCTET * data

Detailed Description

generic bit string structure (dynamic)

Definition at line 458 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1DynBitStr64 struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSSIZE numbits
- const OSOCTET * data

Detailed Description

Dynamic bit string structure that can hold bit strings with lengths up to 64 bits in size

Definition at line 465 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- `asn1type.h`

ASN1Interval struct Reference

```
#include <asn1type.h>
```

Classes

Public Attributes

- ASN1Duration duration
- ASN1IntervalDE de
- ASN1IntervalSE se
- ASN1IntervalSD sd
- union ASN1Interval::@0 spec
- OSUINT32 recurrences

Detailed Description

Represents a recurring or non-recurring interval.

Definition at line 658 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- `asn1type.h`

ASN1IntervalDE struct Reference

```
#include <asn1type.h>
```

Public Attributes

- ASN1Duration duration
- ASN1DateTime end

Detailed Description

Represents an interval with a duration and possibly an end point.

Definition at line 631 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1IntervalSD struct Reference

```
#include <asn1type.h>
```

Public Attributes

- ASN1DateTime start
- ASN1Duration duration

Detailed Description

Represents an interval with a start point and a duration.

Definition at line 649 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1IntervalSE struct Reference

```
#include <asn1type.h>
```

Public Attributes

- ASN1DateTime start
- ASN1DateTime end

Detailed Description

Represents an interval with a start point and an end point.

Definition at line 640 of file asn1type.h

The Documentation for this struct was generated from the following file:

- `asn1type.h`

Asn1Object struct Reference

```
#include <asn1type.h>
```

Public Attributes

- `ASN1OpenType` encoded
- `void *` decoded
- `OSINT32` index

Detailed Description

A generic table constraint value holder. This structure contains the encoded open type value, a pointer-to-void that holds the decoded content, and the integer-valued index of the table constraint value.

Definition at line 951 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- `asn1type.h`

ASN1OBJID struct Reference

```
#include <asn1type.h>
```

Public Attributes

- `OSUINT32` `numids`
- `OSUINT32` `subid[ASN_K_MAXSUBIDS]`

Detailed Description

This structure describes an object identifier with 32-bit arcs.

Definition at line 275 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- `asn1type.h`

Member Data Documentation

OSUINT32 ASN1OBJID::numids

The number of sub-identifiers in the OID.

Definition at line 277 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- asn1type.h

OSUINT32 ASN1OBJID::subid[ASN_K_MAXSUBIDS]

An array of sub-identifiers.

Definition at line 279 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1OctStr struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 numocts
- OSOCTET data[1]

Detailed Description

A generic octet string structure. This contains the number of octets and a data array with a size of one.

Definition at line 445 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1OID64 struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 numids
- OSUINT64 subid[ASN_K_MAXSUBIDS]

Detailed Description

This structure describes an object identifier with 64-bit arcs.

Definition at line 285 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

OSUINT32 ASN1OID64::numids

The number of sub-identifiers in the OID.

Definition at line 287 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSUINT64 ASN1OID64::subid[ASN_K_MAXSUBIDS]

An array of sub-identifiers.

Definition at line 289 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1OpenType struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSSIZE numocts
- const OSOCTET * data

Detailed Description

A generic open type structure. This structure contains a number of octets and the data that compose the open type information.

Definition at line 941 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1SeqOf struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 n
- void * elem

Detailed Description

A generic SEQUENCE OF structure that contains a number of elements and a pointer-to-void that contains the contents.

Definition at line 916 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

OSUINT32 ASN1SeqOf::n

The number of elements.

Definition at line 918 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

void* ASN1SeqOf::elem

The pointer-to-void that contains the elements.

Definition at line 921 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1SeqOfOctStr struct Reference

```
#include <asn1type.h>
```

Public Attributes

- OSUINT32 n
- OSDynOctStr * elem

Detailed Description

A generic SEQUENCE OF dynamic OCTET STRING.

This structure is used to hold a sequence of octet strings. The elements are pointers-to-OSDynOctStr.

Definition at line 929 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

OSUINT32 ASN1SeqOfOctStr::n

The number of elements.

Definition at line 931 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

OSDynOctStr* ASN1SeqOfOctStr::elem

A pointer-to-OSDynOctStr that contains the elements.

Definition at line 934 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

ASN1Time struct Reference

```
#include <asn1type.h>
```

Classes

Public Attributes

- OSUINT16 settings
- ASN1DateTime dateTime
- ASN1Interval interval
- union ASN1Time::@1 val

Detailed Description

Represents an ASN.1 TIME abstract value. The settings field indicates what fields are present.

Definition at line 674 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

Member Data Documentation

OSUINT16 ASN1Time::settings

Combination of ASN1TIMEFIELD_* flags indicating what fields are present in this TIME value.

Definition at line 679 of file asn1type.h

The Documentation for this struct was generated from the following file:

- asn1type.h

DirBufDesc struct Reference

Public Attributes

- OSCTXT * pctxt
- OSRTSTREAM * pUnderStream
- size_t savedIndex

OSBigInt struct Reference

Public Attributes

- OSSIZE numocts
- OSOCTET * mag
- int sign
- OSSIZE allocated
- OSBOOL dynamic

OSBufferIndex struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- OSSIZE byteIndex
- OSINT16 bitOffset

Detailed Description

This structure can be used as an index into the buffer.

Definition at line 121 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSCTXT struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- void * pMemHeap
- OSRTBuffer buffer
- OSRTBufSave savedInfo
- OSRTErrInfoList errInfo
- OSUINT32 initCode
- OSRTFLAGS flags
- OSOCTET level
- OSOCTET state
- OSOCTET diagLevel
- OSOCTET lastChar
- struct OSRTSTREAM * pStream
- struct OSRTPrintStream * pPrintStrm
- OSRTDList elemNameStack
- OSRTDList regExpCache
- OSRTStack containerEndIndexStack
- const OSOCTET * key
- OSSIZE keylen
- OSVoidPtr pXMLInfo
- OSVoidPtr pASN1Info
- OSVoidPtr pLicInfo
- OSVoidPtr pUserData
- OSVoidPtr pGlobalData
- struct OS3GPPSecParams * p3gppSec
- OSFreeCtxtGlobalPtr gblFreeFunc
- OSVoidPtr ssl
- struct OSRTDiagBitFieldList * pBitFldList
- OSUINT16 indent
- OSUINT16 version

Detailed Description

Run-time context structure

This structure is a container structure that holds all working variables involved in encoding or decoding a message.

Definition at line 197 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

Member Data Documentation

OSRTStack OSCTXT::containerEndIndexStack

Stack of OSBufferIndex, representing pointers to the end of currently open containers having length determinants. Each OSBufferIndex represents the value of the buffer's byteIndex and bitOffset after the container has been decoded (i.e. the location of the first bit beyond the container). Used by 3GPP decoders.

Definition at line 226 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSRTBuffer struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- OSOCTET * data
- OSSIZE byteIndex
- OSSIZE size
- OSINT16 bitOffset
- OSBOOL dynamic
- OSBOOL aligned

Detailed Description

Run-time message buffer structure

This structure holds encoded message data. For an encode operation, it is where the message being built is stored. For decode, it holds a copy of the message that is being decoded.

Definition at line 94 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSRTBufSave struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- OSSIZE byteIndex
- OSINT16 bitOffset
- OSRTFLAGS flags

Detailed Description

Structure to save the current message buffer state

This structure is used to save the current state of the buffer.

Definition at line 111 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSRTDList struct Reference

```
#include <rtxDList.h>
```

Public Attributes

- OSSIZE count
- OSRTDListNode * head
- OSRTDListNode * tail

Detailed Description

This is the main list structure. It contains a count of the number of elements in the list and pointers to the list head and tail elements.

Definition at line 64 of file rxDList.h

The Documentation for this struct was generated from the following file:

- rxDList.h

Member Data Documentation

OSSIZE OSRTDList::count

Count of items in the list.

Definition at line 65 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

OSRTDListNode* OSRTDList::head

Pointer to first entry in list.

Definition at line 66 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

OSRTDListNode* OSRTDList::tail

Pointer to last entry in list.

Definition at line 67 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

OSRTDListBuf struct Reference

Public Attributes

- OSSIZE n
- OSSIZE nMax
- OSSIZE nAll
- OSSIZE firstSegSz
- OSSIZE elemSize
- OSRTDList tmplist
- void ** dataArray

OSRTDListNode struct Reference

```
#include <rtxDList.h>
```

Public Attributes

- void * data
- struct OSRTDListNode * next
- struct OSRTDListNode * prev

Detailed Description

This structure is used to hold a single data item within the list. It contains a void pointer to point at any type of data item and forward and backward pointers to the next and previous entries in the list.

Definition at line 52 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

Member Data Documentation

void* OSRTDListNode::data

Pointer to list data item.

Definition at line 53 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

struct OSRTDListNode* OSRTDListNode::next

Pointer to next node in list.

Definition at line 54 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

struct OSRTDListNode* OSRTDListNode::prev

Pointer to previous node in list.

Definition at line 55 of file rtxDList.h

The Documentation for this struct was generated from the following file:

- rtxDList.h

OSRTDListUTF8StrNode struct Reference

Public Attributes

- OSRTDListNode node
- OSUTF8CHAR utf8chars[1]

OSRTErrInfo struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- OSRErrLocn stack[OSRTERRSTKSIZ]
- OSINT16 status
- OSUINT8 stkx
- OSUINT8 parment
- OSUTF8CHAR * parms[OSRTMAXERRPRM]
- OSUTF8CHAR * elemName
- OSBOOL fatal

Detailed Description

Run-time error information structure

This structure is a container structure that holds information on run-time errors. The stack variable holds the trace stack information that shows where the error occurred in the source code. The parms variable holds error parameters that are substituted into the message that is returned to the user.

Definition at line 67 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSRErrInfoList struct Reference

Public Attributes

- OSRTDList list
- OSRErrInfo reserved
- OSRTDListNode reservedNode

OSRErrLocn struct Reference

```
#include <rtxContext.h>
```

Public Attributes

- const OSUTF8CHAR * module
- OSINT32 lineno

Detailed Description

Run-time error location structure

This structure is a container structure that holds information on the location within a C source file where a run-time error occurred.

Definition at line 52 of file rtxContext.h

The Documentation for this struct was generated from the following file:

- rtxContext.h

OSRTMEMBUF struct Reference

Public Attributes

- OSCTXT * pctxt
- OSSIZE segsize
- OSSIZE startidx
- OSSIZE usedcnt
- OSSIZE bufsize
- OSSIZE bitOffset
- OSUINT32 userState
- OSOCTET * buffer
- OSBOOL isDynamic
- OSBOOL isExpandable
- OSBOOL useSysMem

OSRTPrintStream struct Reference

```
#include <rtxPrintStream.h>
```

Public Attributes

- rtxPrintCallback pfPrintFunc
- void * pPrntStrmInfo

Detailed Description

Structure to hold information about a global PrintStream.

Definition at line 51 of file rtxPrintStream.h

The Documentation for this struct was generated from the following file:

- rtxPrintStream.h

OSRTStrBuf struct Reference

Public Attributes

- char * strbuf
- OSSIZE bufsize
- OSSIZE endx

OSRTSTREAM struct Reference

```
#include <rtxStream.h>
```

Public Attributes

- OSRTStreamReadProc read
- OSRTStreamWriteProc write
- OSRTStreamFlushProc flush
- OSRTStreamCloseProc close
- OSRTStreamSkipProc skip
- OSRTStreamMarkProc mark
- OSRTStreamResetProc reset
- OSRTStreamGetPosProc getPos
- OSRTStreamSetPosProc setPos
- void * extra
- size_t bufsize
- size_t readAheadLimit
- size_t bytesProcessed
- size_t markedBytesProcessed
- size_t ioBytes
- size_t nextMarkOffset
- size_t segsize
- OSUINT32 id
- OSRTMEMBUF * pCaptureBuf
- OSUINT16 flags

Detailed Description

The stream control block. A user may implement a customized stream by defining read, skip, close functions for input streams and write, flush, close for output streams.

Definition at line 184 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

Member Data Documentation

OSRTStreamReadProc OSRTSTREAM::read

pointer to read function

Definition at line 185 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamWriteProc OSRTSTREAM::write

pointer to write function

Definition at line 186 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamFlushProc OSRTSTREAM::flush

pointer to flush function

Definition at line 187 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamCloseProc OSRTSTREAM::close

pointer to close function

Definition at line 188 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamSkipProc OSRTSTREAM::skip

pointer to skip function

Definition at line 189 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamMarkProc OSRTSTREAM::mark

pointer to mark function

Definition at line 190 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamResetProc OSRTSTREAM::reset

pointer to reset function

Definition at line 191 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamGetPosProc OSRTSTREAM::getPos

pointer to getPos function

Definition at line 192 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTStreamSetPosProc OSRTSTREAM::setPos

pointer to setPos function

Definition at line 193 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

void* OSRTSTREAM::extra

pointer to stream-specific data

Definition at line 195 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

size_t OSRTSTREAM::bufsize

physical size of `pctx->buffer.data` buffer. `pctx->buffer.size` represents the logical size - the amount of actual data held in the buffer.

Definition at line 196 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- `rtxStream.h`

size_t OSRTSTREAM::readAheadLimit

read ahead limit (used by `rtxStreamMark/rtxStreamReset`)

Definition at line 200 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- `rtxStream.h`

size_t OSRTSTREAM::bytesProcessed

the number of bytes processed by the application program

Definition at line 202 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- `rtxStream.h`

size_t OSRTSTREAM::markedBytesProcessed

the marked number of bytes already processed

Definition at line 204 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- `rtxStream.h`

size_t OSRTSTREAM::ioBytes

the actual number of bytes read from or written to the stream

Definition at line 206 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- `rtxStream.h`

size_t OSRTSTREAM::nextMarkOffset

offset of next appropriate mark position

Definition at line 208 of file `rtxStream.h`

The Documentation for this struct was generated from the following file:

- rtxStream.h

size_t OSRTSTREAM::segsz

size of decoded segment

Definition at line 210 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSUINT32 OSRTSTREAM::id

id of stream (see OSRTSTRMID_* macros)

Definition at line 211 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSRTMEMBUF* OSRTSTREAM::pCaptureBuf

Buffer into which data read from stream can be captured for debugging purposes.

Definition at line 217 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSUINT16 OSRTSTREAM::flags

flags (see OSRTSTRMF_* macros)

Definition at line 219 of file rtxStream.h

The Documentation for this struct was generated from the following file:

- rtxStream.h

OSXSDAny struct Reference

```
#include <asn1type.h>
```

Classes

Public Attributes

- OSXSDAnyAlt t
- ASNIOpenType * binary

- `const OSUTF8CHAR * xmlText`
- `union OSXSDAny::@2 u`

Detailed Description

Structure to hold xsd:any data in binary and XML text form.

Definition at line 964 of file `asn1type.h`

The Documentation for this struct was generated from the following file:

- `asn1type.h`

Chapter 4. File Documentation

- `int rtxSocketRecv (OSRTOCKET socket, OSOCTET * pbuf, size_t bufsize)`
- `int rtxSocketRecvTimed (OSRTOCKET socket, OSOCTET * pbuf, size_t bufsize, OSUINT32 secs)`
- `int rtxSocketSelect (int nfds, fd_set * readfds, fd_set * writefds, fd_set * exceptfds, struct timeval * timeout)`
- `int rtxSocketSend (OSRTOCKET socket, const OSOCTET * pdata, size_t size)`
- `int rtxSocketSetBlocking (OSRTOCKET socket, OSBOOL value)`
- `int rtxSocketStrToAddr (const char * pIPAddrStr, OSIPADDR * pIPAddr)`

Detailed Description

Definition in file `rtxSocket.h`

rtxStack.h File Reference

```
#include "rtxsrc/rtxDList.h"
```

Classes

- struct _OSRTStack

Macros

- #define rtxStackIsEmpty (OSBOOL)((stack).dlist.count == 0)

Typedefs

- typedef struct _OSRTStack OSRTStack

Functions

- OSRTStack * rtxStackCreate (struct OSCTXT * pctxt)
- void rtxStackInit (struct OSCTXT * pctxt, OSRTStack * pStack)
- void * rtxStackPop (OSRTStack * pStack)
- int rtxStackPush (OSRTStack * pStack, void * pData)
- void * rtxStackPeek (OSRTStack * pStack)

Detailed Description

Simple FIFO stack for storing void pointers to any type of data.

Definition in file rtxStack.h

rtxStream.h File Reference

```
#include "rtxsrc/rtxContext.h"
```

```
#include "rtxsrc/rtxMemBuf.h"
```
